

OMAP35x Applications Processor

Technical Reference Manual

Literature Number: SPRUF98P
April 2010–Revised March 2011

Preface	165
1 Introduction	175
1.1 Overview	176
1.1.1 OneDRAM Implementation	177
1.2 Environment	178
1.3 Description	179
1.3.1 MPU Subsystem	180
1.3.2 IVA2.2 Subsystem	181
1.3.3 On-Chip Memory	182
1.3.4 External Memory Interfaces	182
1.3.5 DMA Controllers	182
1.3.6 POWERVR SGX™ Graphics Accelerator subsystem (GPU)	183
1.3.7 Multimedia Accelerators	183
1.3.8 Comprehensive Power Management	183
1.3.9 Peripherals	184
1.4 Package-On-Package Concept	185
1.5 OMAP35x Family	188
1.5.1 Device Features	188
1.5.2 Device Identification	190
1.5.2.1 720MHz Device Identification	193
1.5.2.1.1 Procedure for Calculation of SmartReflex nValue for OPP6	193
1.5.3 General Recommendations Relative to Unavailable Features/Modules	194
2 Memory Mapping	195
2.1 Introduction	196
2.2 Global Memory Space Mapping	198
2.3 L3 and L4 Memory Space Mapping	201
2.3.1 L3 Memory Space Mapping	201
2.3.2 L4 Memory Space Mapping	202
2.3.2.1 L4-Core Memory Space Mapping	202
2.3.2.2 L4-Wakeup Memory Space Mapping	205
2.3.2.3 L4-Peripheral Memory Space Mapping	206
2.3.2.4 L4-Emulation Memory Space Mapping	207
2.3.3 Register Access Restrictions	208
2.4 IVA2.2 Subsystem Memory Space Mapping	210
2.4.1 IVA2.2 Subsystem Internal Memory and Cache Allocation	210
2.4.1.1 IVA2.2 Subsystem Memory Hierarchy	210
2.4.1.2 IVA2.2 Cache Allocation	211
2.4.2 DSP Access to L2 Memories	212
2.4.2.1 DSP Access to L2 ROM	212
2.4.2.2 DSP Access to L2 RAM	212
2.4.3 DSP and EDMA Access to Memories and Peripherals	212
2.4.4 L3 Interconnect View of the IVA2.2 Subsystem Memory Space	213
2.4.5 DSP View of the IVA2.2 Subsystem Memory Space	213
2.4.6 EDMA View of the IVA2.2 Subsystem Memory Space	215
3 MPU Subsystem	217

3.1	MPU Subsystem Overview	218
3.1.1	Introduction	218
3.1.2	Features	219
3.2	MPU Subsystem Integration	220
3.2.1	MPU Subsystem Clock and Reset Distribution	222
3.2.1.1	Clock Distribution	222
3.2.1.2	Reset Distribution	223
3.2.2	ARM Subchip	224
3.2.2.1	ARM Overview	224
3.2.2.2	ARM Description	224
3.2.2.2.1	Public ARM Cortex-A8 Instruction, Data, and Private Peripheral Port	224
3.2.2.2.2	MPU Subsystem Features	224
3.2.2.3	Clock, Reset, and Power Management	225
3.2.2.3.1	Clocks	225
3.2.2.3.2	Reset	225
3.2.2.3.3	Power Management	225
3.2.3	AXI2OCP and I2Async Bridges	225
3.2.3.1	Bridges Overview	225
3.2.3.2	AXI2OCP Description	226
3.2.3.3	Clocks, Reset, and Power Management	227
3.2.3.3.1	Clocks	227
3.2.3.3.2	Reset	227
3.2.3.3.3	Power Management	227
3.2.4	Interrupt Controller	227
3.2.4.1	Clocks	227
3.2.4.2	Reset	227
3.2.4.3	Power Management	227
3.3	MPU Subsystem Functional Description	228
3.3.1	Interrupts	228
3.3.2	Power Management	228
3.3.2.1	Power Domains	228
3.3.2.2	Power States	229
3.3.2.3	Power Modes	229
3.3.2.4	Transitions	233
3.4	MPU Subsystem Basic Programming Model	234
3.4.1	Clock Control	234
3.4.2	MPU Power Mode Transitions	234
3.4.2.1	Basic Power-On Reset	234
3.4.2.2	MPU to Standby Mode	234
3.4.2.3	MPU Out of Standby Mode	234
3.4.2.4	MPU Power-On from a Powered-Off State	234
3.4.3	Neon Power Mode Transition	235
3.4.4	ARM Programming Model	235
4	Power, Reset and Clock Management	237
4.1	Introduction to Power Management	238
4.1.1	Goal of Power Management	238
4.1.2	Power-Management Techniques	238
4.1.2.1	Dynamic Voltage and Frequency Scaling	238
4.1.2.2	Dynamic Power Switching	239
4.1.2.3	Standby Leakage Management	240
4.1.2.4	DPS Versus SLM	240
4.1.2.5	Combining Power-Management Techniques	241
4.1.3	Architectural Blocks for Power Management	242

4.1.3.1	Clock Domain	242
4.1.3.2	Power Domain	243
4.1.3.3	Voltage Domain	244
4.1.4	Device Power-Management Architecture	244
4.1.4.1	Module Interface and Functional Clocks	245
4.1.4.2	Autoidle Clock Control	246
4.2	PRCM Overview	248
4.2.1	Introduction	248
4.2.2	PRCM Features	250
4.3	PRCM Environment	251
4.3.1	External Clock Signals	252
4.3.2	External Reset Signals	253
4.3.3	External Power Signals	254
4.4	PRCM Integration	255
4.4.1	Power-Management Scheme, Reset, and Interrupt Requests	258
4.4.1.1	Power Domain	258
4.4.1.2	Resets	258
4.4.1.3	Interrupt Requests	259
4.5	PRCM Reset Manager Functional Description	260
4.5.1	Overview	260
4.5.2	General Characteristics of Reset Signals	260
4.5.2.1	Scope	261
4.5.2.2	Occurrence	261
4.5.2.3	Source Type	261
4.5.3	Reset Sources	261
4.5.3.1	Global Reset Sources	262
4.5.3.2	Local Reset Sources	263
4.5.4	Reset Distribution	264
4.5.5	Power Domain Reset Descriptions	265
4.5.5.1	MPU Power Domain	265
4.5.5.2	NEON Power Domain	265
4.5.5.3	IVA2 Power Domain	265
4.5.5.4	CORE Power Domain	265
4.5.5.5	DSS Power Domain	266
4.5.5.6	CAM Power Domain	266
4.5.5.7	USBHOST Power Domain	266
4.5.5.8	SGX Power Domain	266
4.5.5.9	WKUP Power Domain	266
4.5.5.10	PER Power Domain	267
4.5.5.11	DPLL Power Domains	267
4.5.5.12	EFUSE Power Domain	267
4.5.5.13	BANDGAP Logic	267
4.5.5.14	External Warm Reset Assertion	268
4.5.6	Reset Logging	268
4.5.6.1	PRCM Reset Logging Mechanism	268
4.5.6.2	SCM Reset Logging	269
4.5.7	Reset Management Overview	269
4.5.8	Reset Summary	274
4.5.9	Reset Sequences	277
4.5.9.1	Power-Up Sequence	277
4.5.9.2	Global Warm Reset Sequence	279
4.5.9.3	IVA2.2 Subsystem Power-Up Sequence	282
4.5.9.4	IVA2 Software Reset Sequence	285

4.5.9.5	IVA2 Global Warm Reset Sequence	287
4.5.9.6	IVA2 Power Domain Wake-Up Cold Reset Sequence	289
4.6	PRCM Power Manager Functional Description	292
4.6.1	Overview	292
4.6.1.1	Introduction	292
4.6.1.2	Device Partitioning	293
4.6.1.3	Memory and Logic Power Management	295
4.6.1.4	Power Domain States	295
4.6.1.5	Power State Transitions	296
4.6.1.6	Device Power Modes	296
4.6.1.7	Isolation Between Power Domains	297
4.6.2	Power Domain Implementation	297
4.6.2.1	Device Power Domains	297
4.6.2.2	Power Domain Memory Status	299
4.6.2.3	Power Domain State Transition Rules	299
4.6.2.4	Power Domain Dependencies	299
4.6.2.5	Power Domain Controls	299
4.6.2.5.1	Power Domain Hardware Control	299
4.6.2.5.2	Power Domain Software Controls	299
4.7	PRCM Clock Manager Functional Description	301
4.7.1	Overview	301
4.7.1.1	Interface and Functional Clocks	302
4.7.2	External Clock I/Os	303
4.7.2.1	External Clock Inputs	303
4.7.2.1.1	32-kHz Always-On Clock	303
4.7.2.1.2	High-Frequency System Clock	303
4.7.2.1.3	Alternate Clock	304
4.7.2.2	External Clock Outputs	304
4.7.2.3	Summary	304
4.7.3	Internal Clock Generation	304
4.7.3.1	PRM	306
4.7.3.2	CM	308
4.7.3.3	DPLLs	310
4.7.3.3.1	DPLL1 (MPU) and DPLL2 (IVA2)	311
4.7.3.3.2	DPLL3 (CORE)	311
4.7.3.3.3	DPLL4 (Peripherals)	312
4.7.3.3.4	DPLL5 (Peripherals)	313
4.7.3.3.5	DPLL Clock Summary	315
4.7.3.4	Summary	315
4.7.4	Clock Distribution	316
4.7.4.1	Power Domain Clock Distribution	316
4.7.4.1.1	MPU Power Domain	316
4.7.4.1.2	IVA2 Power Domain	316
4.7.4.1.3	SGX Power Domain	317
4.7.4.1.4	CORE Power Domain	318
4.7.4.1.5	EFUSE Power Domain	321
4.7.4.1.6	DSS Power Domain	322
4.7.4.1.7	CAM Power Domain	323
4.7.4.1.8	USBHOST Power Domain	324
4.7.4.1.9	WKUP Power Domain	325
4.7.4.1.10	PER Power Domain	326
4.7.4.1.11	DPLL Domains	327
4.7.4.2	Clock Distribution Summary	329

4.7.4.2.1	Power Domain Source Clocks	329
4.7.4.2.2	Peripheral Module Clocks	330
4.7.5	External Clock Controls	331
4.7.5.1	Clock Request (sys_clkreq) Control	331
4.7.5.2	System Clock Oscillator Control	332
4.7.5.3	External Output Clock1 (sys_clkout1) Control	335
4.7.5.4	External Output Clock2 (sys_clkout2) Control	335
4.7.6	DPLL Control	335
4.7.6.1	DPLL Multiplier and Divider Factors	335
4.7.6.2	DPLL Modes	335
4.7.6.3	DPLL Low-Power Mode	337
4.7.6.4	DPLL Clock Path Power Down	338
4.7.6.5	Recalibration	338
4.7.6.6	DPLL Programming Sequence	339
4.7.7	Internal Clock Controls	340
4.7.7.1	PRM Source-Clock Controls	340
4.7.7.2	CM Source-Clock Controls	342
4.7.7.3	Common Interface Clock Controls	343
4.7.7.4	DPLL Source-Clock Controls	344
4.7.7.5	SGX Power Domain Clock Controls	344
4.7.7.6	CORE Power Domain Clock Controls	346
4.7.7.7	EFUSE Power Domain Clock Controls	348
4.7.7.8	DSS Power Domain Clock Controls	348
4.7.7.9	CAM Power Domain Clock Controls	349
4.7.7.10	USBHOST Power Domain Clock Controls	350
4.7.7.11	WKUP Power Domain Clock Controls	351
4.7.7.12	PER Power Domain Clock Controls	352
4.7.8	Clock Configurations	354
4.7.8.1	Processor Clock Configurations	354
4.7.8.2	Interface and Peripheral Functional Clock Configurations	356
4.8	PRCM Idle and Wake-Up Management	358
4.8.1	Overview	358
4.8.2	Sleep Transition	360
4.8.3	Wakeup	360
4.8.4	Device Wake-Up Events	360
4.8.5	Sleep and Wake-Up Dependencies	366
4.8.5.1	Sleep Dependencies	366
4.8.5.2	Wake-Up Dependencies	367
4.8.6	USBHOST/USBTLL Save-and-Restore Management	370
4.8.6.1	USBHOST SAR Sequences	372
4.8.6.1.1	Save Sequence on Sleep Transition	372
4.8.6.1.2	Restore Sequence on Wake-Up Transition	372
4.8.6.2	USB TLL SAR Sequences	372
4.8.6.2.1	Save Sequence on Sleep Transition	372
4.8.6.2.2	Restore Sequence on Wake-Up Transition	372
4.9	PRCM Interrupts	373
4.10	PRCM Voltage Management Functional Description	374
4.10.1	Overview	374
4.10.2	Voltage Domains	377
4.10.3	Voltage Domain Dependencies	378
4.10.4	Voltage-Control Architecture	380
4.10.5	VDD1 and VDD2 Control	381
4.10.5.1	Direct Control With VMODE Signals	382

4.10.5.2	Direct Voltage Control With I ² C Interface	382
4.10.5.3	Voltage Controller and Dedicated I ² C Interface	383
4.10.6	Analog Cells, LDOs, and Level Shifter Controls	383
4.10.6.1	SRAM Voltage Control	383
4.10.6.2	Wake-Up and Emulation Voltage Control	383
4.11	PRCM Off-Mode Management	384
4.11.1	Overview	384
4.11.2	Device Off-Mode Configuration	384
4.11.2.1	Overview	384
4.11.2.2	I/O Wake-Up Mechanism	385
4.11.3	CORE Power Domain Off-Mode Sequences	386
4.11.3.1	Sleep Sequences (Transition From On to Retention/Off)	386
4.11.3.2	Wake-Up Sequences (Transition From Retention/Off to On)	387
4.11.4	Device Off-Mode Sequences	387
4.11.4.1	Sleep Sequences	387
4.11.4.1.1	Device Off-Mode Transition Without Using the SYS_OFF_MODE Signal	388
4.11.4.1.2	Device Off-Mode Transition Using Only the SYS_OFF_MODE Signal	388
4.11.4.2	Wake-Up Sequences	389
4.11.4.2.1	Device Wakeup from Off Mode Without Using the SYS_OFF_MODE Signal	389
4.11.4.2.2	Device Wakeup From Off Mode Using Only the SYS_OFF_MODE Signal	390
4.12	PRCM Basic Programming Model	390
4.12.1	Global Registers	390
4.12.1.1	Revision Information Registers	390
4.12.1.2	PRCM Configuration Registers	390
4.12.1.3	Interrupt Configuration Registers	390
4.12.1.3.1	MPU Interrupt Event Sources	391
4.12.1.3.2	MPU Interrupt Registers	391
4.12.1.3.3	IVA2.2 Interrupt Event Sources	392
4.12.1.3.4	IVA2 Interrupt Registers	392
4.12.1.4	Event Generator Control Registers	392
4.12.1.5	Output Signal Polarity Control Registers	392
4.12.1.5.1	CM_POLCTRL (CM Polarity Control Register)	392
4.12.1.5.2	PRM_POLCTRL (PRM Polarity Control Register)	394
4.12.1.6	SRAM Precharge Time Control Register	394
4.12.1.6.1	PRM_SRAM_PCHARGE (Voltage SRAM Precharge Counter Register)	394
4.12.2	Clock Management Registers	394
4.12.2.1	System Clock Control Registers	394
4.12.2.1.1	PRM_CLKSRC_CTRL (Clock Source Control Register)	394
4.12.2.1.2	PRM_CLKSETUP (Source-Clock Setup Register)	394
4.12.2.1.3	PRM_CLKSEL (Source-Clock Selection Register)	395
4.12.2.2	External Clock Output Control Registers	395
4.12.2.2.1	PRM_CLKOUT_CTRL (Clock Out Control Register)	395
4.12.2.2.2	CM_CLKOUT_CTRL (Clock Out Control Register)	395
4.12.2.3	DPLL Clock Control Registers	395
4.12.2.3.1	CM_CLKSELn_PLL_ <processor_name> (Processor DPLL Clock Selection Register) ...	395
4.12.2.3.2	CM_CLKSELn_PLL (DPLL Clock Selection Register)	396
4.12.2.3.3	CM_CLKEN_PLL_ <processor_name> (Processor DPLL Clock Enable Register)	396
4.12.2.3.4	CM_CLKEN_PLL (DPLL Enable Register)	396
4.12.2.3.5	CM_AUTOIDLE_PLL_ <processor_name> (Processor DPLL Autoidle Register)	397
4.12.2.3.6	CM_AUTOIDLE_PLL (DPLL Autoidle Register)	397
4.12.2.3.7	CM_AUTOIDLE1_PLL (DPLL5 Autoidle Register)	397
4.12.2.3.8	CM_IDLEST_CKGEN (Source-Clock Idle-Status Register)	397
4.12.2.3.9	CM_IDLEST2_CKGEN (DPLL5 Source-Clock Idle-Status Register)	398

4.12.2.3.10	CM_IDLEST_PLL_ <processor_name> (Processor DPLL Idle-Status Register)	398
4.12.2.4	Power-Domain Clock Control Registers	398
4.12.2.4.1	CM_CLKSEL_ <domain_name> (Clock Select Register)	398
4.12.2.4.2	CM_FCLKEN_ <domain_name> (Functional Clock Enable Register)	399
4.12.2.4.3	CM_ICLKEN_ <domain_name> (Interface Clock Enable Register)	399
4.12.2.4.4	CM_AUTOIDLE_ <domain_name> (Autoidle Register)	400
4.12.2.4.5	CM_IDLEST_ <domain_name> (Idle-Status Register)	400
4.12.2.4.6	CM_CLKSTCTRL_ <domain_name> (Clock State Control Register)	401
4.12.2.4.7	CM_CLKSTST_ <domain_name> (Clock State Status Register)	402
4.12.2.4.8	CM_SLEEPDEP_ <domain_name> (Sleep Dependency Control Register)	402
4.12.2.5	Domain Wake-Up Control Registers	403
4.12.2.5.1	PM_WKEN_ <domain_name> (Wake-Up Enable Register)	403
4.12.2.5.2	PM_WKST_ <domain_name> (Wake-Up Status Register)	404
4.12.2.5.3	PM_WKDEP_ <domain_name> (Wake-Up Dependency Register)	404
4.12.2.5.4	PM_ <processor_name> GRPSEL_ <domain_name> (Processor Group Selection Register)	405
4.12.3	Reset Management Registers	406
4.12.3.1	Reset Control	406
4.12.3.1.1	PRM_RSTTIME (Reset Time Register)	406
4.12.3.1.2	RM_RSTCTRL_ <domain_name> (Reset Control Register)	406
4.12.3.1.3	RM_RSTST_ <domain_name> (Reset Status Register)	406
4.12.4	Power Management Registers	408
4.12.4.1	PM_PWSTCTRL_ <domain_name> (Power State Control Register)	408
4.12.4.2	PM_PWSTST_ <domain_name> (Power State Status Register)	410
4.12.4.3	PM_PREPWSTST_ <domain_name> (Previous Power State Status Register)	411
4.12.5	Voltage Management Registers	411
4.12.5.1	External Voltage Control Register Descriptions	411
4.12.5.1.1	PRM_VOLTSETUP (Voltage Setup Time Register)	411
4.12.5.1.2	PRM_VOLTOFFSET (Voltage Offset Register)	412
4.12.5.1.3	PRM_VOLTCTRL (Voltage Source Control Register)	413
4.12.5.2	Voltage Controller Registers	413
4.12.5.2.1	PRM_VC_SMPS_SA (Voltage Controller SMPS Slave Address Register)	414
4.12.5.2.2	PRM_VC_SMPS_VOL_RA (Voltage Controller SMPS Voltage Register Address Register)	414
4.12.5.2.3	PRM_VC_SMPS_CMD_RA (Voltage Controller SMPS Command Register Address Register)	414
4.12.5.2.4	PRM_VC_CMD_VAL_0 and PRM_VC_CMD_VAL_1 (Voltage Controller Command and Voltage Value Register 0 and 1)	414
4.12.5.2.5	PRM_VC_CH_CONF (Voltage Controller Channel Configuration Register)	414
4.12.5.2.6	PRM_VC_I2C_CFG (Voltage Controller I ² C Interface Configuration Register)	414
4.12.5.2.7	PRM_VC_BYPASS_VAL (Voltage Controller Bypass Command Register)	415
4.12.6	Generic Programming Examples	415
4.12.6.1	Clock Control	415
4.12.6.1.1	Enabling and Disabling the Functional Clocks	415
4.12.6.1.2	Enabling and Disabling the Interface Clocks	417
4.12.6.1.3	Enabling and Disabling the Inactive State	418
4.12.6.1.4	Processor Clock Control	419
4.12.6.2	Reset Management	422
4.12.6.3	Wake-Up Control	422
4.12.6.4	Voltage Controller Initialization Basic Programming Model	423
4.12.6.5	Event Generator Programming Examples	426
4.13	PRCM Use Cases and Tips	427
4.13.1	Voltage Control Using VMODE	427
4.13.1.1	Introduction	427

4.13.1.2	Programming Sequence	427
4.13.1.2.1	Initialization Procedure	427
4.13.1.2.2	VMODE Signals Toggling	428
4.13.1.2.3	Summary Flow Chart	428
4.14	PRCM Register Manual	430
4.14.1	CM Module Registers	430
4.14.1.1	CM Module Summary	430
4.14.1.2	IVA2_CM Registers	430
4.14.1.3	OCP_System_Reg_CM Registers	437
4.14.1.4	MPU_CM Registers	438
4.14.1.5	CORE_CM Registers	444
4.14.1.6	SGX_CM Registers	458
4.14.1.7	WKUP_CM Registers	462
4.14.1.8	Clock_Control_Reg_CM Registers	467
4.14.1.9	DSS_CM Registers	480
4.14.1.10	CAM_CM Registers	486
4.14.1.11	PER_CM Registers	491
4.14.1.12	EMU_CM Registers	502
4.14.1.13	Global_Reg_CM Registers	507
4.14.1.14	NEON_CM Registers	508
4.14.1.15	USBHOST_CM Registers	509
4.14.2	PRM Module Registers	514
4.14.2.1	PRM Module Summary	514
4.14.2.2	IVA2_PRM Registers	515
4.14.2.3	OCP_System_Reg_PRM Registers	525
4.14.2.4	MPU_PRM Registers	530
4.14.2.5	CORE_PRM Registers	537
4.14.2.6	SGX_PRM Registers	553
4.14.2.7	WKUP_PRM Registers	557
4.14.2.8	Clock_Control_Reg_PRM Registers	561
4.14.2.9	DSS_PRM Registers	563

20.4.3.1	1-Wire Mode Features	2907
20.4.3.2	Description	2907
20.4.3.3	1-Wire Single-Bit Mode Operation	2907
20.4.3.4	Interrupt Conditions	2908
20.4.3.5	Status Flags	2908
20.4.4	Module Power Saving	2908
20.4.4.1	Autoidle Mode	2908
20.4.4.2	Power-Down Mode	2908
20.4.5	System Power Management and Wakeup	2908
20.5	HDQ/1-Wire Basic Programming Model	2910
20.5.1	Module Initialization Sequence	2910
20.5.1.1	Mode Selection	2910
20.5.1.2	Reset/Initialization	2910
20.5.2	HDQ Protocol Basic Programming Model	2910
20.5.2.1	Write Operation	2910
20.5.2.2	Read Operation	2911
20.5.3	1-Wire Mode (SDQ) Basic Programming Model	2911
20.5.3.1	Write Operation	2911
20.5.3.2	Read Operation	2912
20.5.3.3	1-Wire Bit Mode Operation	2912
20.5.4	Power Management	2912
20.5.4.1	Module Power-Down Mode	2912
20.5.4.2	System Idle Mode	2913
20.6	HDQ/1-Wire Use Cases and Tips	2913
20.6.1	How to Configure the HDQ/1-Wire when Connected with a BQ27000 Gauge	2913
20.6.1.1	Environment	2913
20.6.1.2	Programming Flow	2914
20.6.1.3	Pad Configuration and HDQ/1-Wire Clock and Power Management	2914
20.6.1.4	HDQ/1-Wire Software Reset	2915
20.6.1.5	Interrupts Enable	2915
20.6.1.6	Read and Write Operations	2915
20.7	HDQ/1-Wire Register Manual	2916
20.7.1	HDQ/1-Wire Instance Summary	2916
20.7.2	HDQ/1-Wire Register Mapping Summary	2916
20.7.3	HDQ/1-Wire Register Description	2917
21	Multichannel Buffered Serial Port	2923
21.1	McBSP Overview	2924
21.1.1	McBSP Features	2924
21.1.2	SIDETONE Core	2925
21.2	McBSP Environment	2927
21.2.1	McBSP Functions	2927
21.2.2	McBSP Signals Descriptions	2927
21.2.3	McBSP Functions Description	2928
21.2.3.1	McBSP Modes	2928
21.2.3.2	McBSP Functions	2930
21.2.3.2.1	McBSP Function 1: Control and Data	2930
21.2.3.2.2	McBSP Function 2: Audio Data	2930
21.2.3.2.3	McBSP Function 3: Voice Data	2930

21.2.4	McBSP Protocols and Data Formats	2931
21.2.4.1	Words, Frames, and Phases Definitions	2931
21.2.4.1.1	Words or Channels	2931
21.2.4.1.2	Frames	2931
21.2.4.1.3	Phases	2932
21.2.4.2	Serial Protocol and Data Formats	2932
21.2.4.2.1	Protocol	2932
21.2.4.2.2	Data Format	2932
21.2.4.3	Audio Protocol and Data Formats	2933
21.2.4.3.1	Protocol	2933
21.2.4.3.2	Data Formats	2933
21.2.4.4	Voice Protocol and Data Formats	2935
21.2.4.4.1	Protocol	2935
21.2.4.4.2	Data Formats	2935
21.3	McBSP Integration	2936
21.3.1	Signal Source Control	2940
21.3.1.1	McBSP1 Module (6 Pins Configuration)	2940
21.3.1.2	McBSP2, 3, 4, and 5 modules (4 pins configuration)	2941
21.3.2	Clocking, Reset, and Power Management Scheme	2941
21.3.2.1	Power Domain	2941
21.3.2.2	Clocks	2941
21.3.2.2.1	McBSP1 Clocks	2941
21.3.2.2.2	McBSP2 Clocks	2942
21.3.2.2.3	McBSP3 Clocks	2943
21.3.2.2.4	McBSP4 Clocks	2944
21.3.2.2.5	McBSP5 Clocks	2945
21.3.2.2.6	SIDETONE Clock	2946
21.3.2.3	Hardware and Software Reset	2946
21.3.2.4	Power Management	2947
21.3.2.4.1	McBSP Operating States	2947
21.3.2.4.2	McBSP Acknowledgment Modes	2947
21.3.2.4.3	Wake-Up Capability	2949
21.3.2.4.4	Analysis of the Receiver Smart Idle Behavior	2950
21.3.3	Hardware Requests	2953
21.3.3.1	DMA Requests	2953
21.3.3.2	Interrupt Requests	2953
21.3.3.2.1	McBSP Interrupt Requests	2953
21.3.3.2.2	SIDETONE_McBSP Interrupt Requests	2955
21.4	McBSP Functional Description	2957
21.4.1	Block Diagram	2957
21.4.2	McBSP Data Transfer Process	2959
21.4.2.1	Data Transfer Process for 8- / 12- / 16- / 20- / 24- / 32-bits Long Words	2960
21.4.2.2	Bit Reordering (Option to Transfer LSB First)	2960
21.4.2.3	Clocking and Framing Data	2961
21.4.2.3.1	Clocking	2962
21.4.2.3.2	Serial Words	2963
21.4.2.3.3	Frames and Frame Synchronization	2963
21.4.2.3.4	Detecting Frame-Synchronization Pulses, Even in Reset State	2964
21.4.2.3.5	Ignoring Frame-Synchronization Pulses	2964
21.4.2.3.6	Frame Frequency	2964
21.4.2.3.7	Maximum Frame Frequency	2964
21.4.2.4	Frame Phases (Dual-Phase Frame I2S Support)	2965
21.4.2.4.1	Number of Phases, Words, and Bits per Frame	2965

21.4.2.4.2	Single-Phase Frame Example	2966
21.4.2.4.3	Dual-Phase Frame Example	2966
21.4.2.5	McBSP Reception	2967
21.4.2.6	McBSP Transmission	2968
21.4.2.7	Enable/Disable the Transmit and Receive Processes	2969
21.4.2.8	MCBSP Data Transfer Mode	2970
21.4.2.8.1	Transmit Full Cycle Mode	2970
21.4.2.8.2	Transmit Half Cycle Mode	2970
21.4.2.8.3	Receive Full Cycle Mode	2971
21.4.2.8.4	Receive Half Cycle Mode	2971
21.4.3	McBSP SRG	2971
21.4.3.1	Clock Generation in the SRG	2973
21.4.3.2	Frame Sync Generation in the SRG	2974
21.4.3.2.1	Choosing the Width of the Frame-sync Pulse	2974
21.4.3.2.2	Controlling the Period Between the Starting Edges of Frame Sync Pulses	2974
21.4.3.2.3	Keeping FSG Synchronized to an External Clock	2975
21.4.3.3	Synchronizing SRG Outputs to an External Clock	2975
21.4.3.3.1	Operating the Transmitter Synchronously with the Receiver	2975
21.4.3.3.2	Synchronization Examples	2975
21.4.4	McBSP Exception/Error Conditions	2976
21.4.4.1	Introduction	2976
21.4.4.2	Overflow in the Receiver	2977
21.4.4.3	Unexpected Receive Frame-sync Pulse	2978
21.4.4.3.1	Possible Responses to Receive Frame-sync Pulses	2978
21.4.4.3.2	Example of an Unexpected Receive Frame-sync Pulse	2978
21.4.4.3.3	Preventing Unexpected Receive Frame-sync Pulses	2978
21.4.4.4	Underflow in the Receiver	2979
21.4.4.5	Underflow in the Transmitter	2979
21.4.4.6	Unexpected Transmit Frame-sync Pulse	2980
21.4.4.6.1	Possible Responses to Transmit Frame-sync Pulses	2980
21.4.4.6.2	Example of Unexpected Transmit Frame-Synchronization Pulse	2980
21.4.4.6.3	Preventing Unexpected Transmit Frame-sync Pulses	2980
21.4.4.7	Overflow in the Transmitter	2981
21.4.5	McBSP DMA Configuration	2981
21.4.6	Multichannel Selection Modes	2982
21.4.6.1	Channels, Blocks, and Partitions	2982
21.4.6.2	Multichannel Selection	2982
21.4.6.3	Configuring a Frame for Multichannel Selection	2982
21.4.6.4	Using Eight Partitions	2983
21.4.6.5	Receive Multichannel Selection Mode	2984
21.4.6.6	Using Two Partitions (Legacy Only)	2984
21.4.6.7	Transmit Multichannel Selection Modes	2985
21.4.6.7.1	Disabling/Enabling Versus Masking/Unmasking	2986
21.4.6.7.2	Activity on McBSP Pins for Different Values of XMCM	2986
21.4.7	SIDETONE Mode (ALP)	2988
21.4.7.1	Introduction	2988
21.4.7.2	SIDETONE Interface	2988
21.4.7.3	Data Processing Path	2990
21.4.7.4	Data Processing	2991
21.4.7.4.1	Filtering	2991
21.4.7.4.2	Applying Gain	2992
21.4.7.4.3	Enabling SIDETONE	2992
21.4.7.4.4	FIR Accuracy	2992

21.4.7.5	Interrupt Operation	2992
21.5	McBSP Basic Programming Model	2993
21.5.1	McBSP Core	2993
21.5.1.1	McBSP Initialization Procedure	2993
21.5.1.2	Reset and Initialization Procedure for the Sample Rate Generator	2996
21.5.1.3	Data Transfer DMA Request Configuration	2999
21.5.1.4	Interrupt Configuration	2999
21.5.1.4.1	L4-Compliant Interrupt Line	2999
21.5.1.4.2	Legacy Interrupt Line	3000
21.5.1.5	Receiver Configuration	3001
21.5.1.5.1	Resetting (Step 1) and Enabling (Step 3) the Receiver	3001
21.5.1.5.2	Programming the McBSP Registers for the Desired Receiver Configuration (Step 2)	3002
21.5.1.6	Transmitter Configuration	3010
21.5.1.6.1	Resetting (Step 1) and Enabling (Step 3) the Transmitter	3010
21.5.1.6.2	Programming the McBSP Registers for the Desired Transmitter Operation (Step 2)	3011
21.5.1.7	General-Purpose I/O on the McBSP Pins (Legacy Only)	3017
21.5.1.8	Data Packing Examples	3018
21.5.1.8.1	Data Packing Using Frame Length and Word Length	3018
21.5.1.8.2	Data Packing Using Word Length and the Frame-Sync Ignore Function	3019
21.5.2	SIDETONE Feature	3020
21.5.2.1	SIDETONE Activation Procedure	3020
21.5.2.2	SIDETONE Initialization Procedure	3021
21.5.2.3	SIDETONE FIR Coefficients Writing	3021
21.5.2.4	SIDETONE FIR Coefficients Reading	3021
21.6	McBSP Register Manual	3021
21.6.1	McBSP Register Mapping Summary	3022
21.6.2	SIDETONE Register Mapping Summary	3027
21.6.3	McBSP Register Description	3028
21.6.4	SIDETONE Register Description	3077
22	MMC/SD/SDIO Card Interface	3083
22.1	MMC/SD/SDIO Overview	3084
22.1.1	MMC/SD/SDIO Features	3085
22.2	MMC/SD/SDIO Environment	3087
22.2.1	MMC/SD/SDIO Connected to an MMC, an SD, or an SDIO Card	3087
22.2.2	MMC/SD/SDIO Connected to an MMC, an SD, or an SDIO Card Through an External Transceiver Device	3087
22.2.3	MMC/SD/SDIO Functional Interfaces	3088
22.2.3.1	Basic MMC/SD/SDIOi Pins Without External Transceiver	3088
22.2.3.2	Basic MMC/SD/SDIO2 Pins with External Transceiver	3089
22.2.3.3	MMC/SD/SDIO Protocol and Data Format	3089
22.2.3.3.1	Protocol	3090
22.2.3.3.2	Data Format	3091
22.3	MMC/SD/SDIO Integration	3095
22.3.1	Clocking, Reset, and Power-Management Scheme	3095
22.3.1.1	Clocks	3095
22.3.1.1.1	Module Clocks	3095
22.3.1.1.2	Power Management	3096
22.3.1.2	Resets	3098
22.3.1.2.1	Hardware Reset	3098
22.3.1.2.2	Software Reset	3098
22.3.1.3	Power Domain	3099
22.3.2	Hardware Requests	3099
22.3.2.1	DMA Requests	3099

22.3.2.1.1	DMA Receive Mode	3099
22.3.2.1.2	DMA Transmit Mode	3100
22.3.2.2	Interrupt Requests	3101
22.3.2.2.1	Interrupt-Driven Operation	3102
22.3.2.2.2	Polling	3102
22.4	MMC/SD/SDIO Functional Description	3103
22.4.1	Description	3103
22.4.2	Mode Selection	3105
22.4.3	Buffer Management	3106
22.4.3.1	Data Buffer	3106
22.4.3.1.1	Data Buffer Status	3108
22.4.4	Transfer Process	3109
22.4.4.1	Different Types of Commands	3109
22.4.4.2	Different Types of Responses	3109
22.4.5	Transfer or Command Status and Errors Reporting	3109
22.4.6	Transfer Stop	3110
22.4.7	MMC CE-ATA Command Completion Disable Management	3111
22.5	MMC/SD/SDIO Basic Programming Model	3112
22.5.1	MMC/SD/SDIO Host Controller Initialization Flow	3112
22.5.1.1	Enable Interface and Functional clock for MMC Controller	3112
22.5.1.2	MMCHS Soft Reset Flow	3112
22.5.1.3	Set MMCHS Default Capabilities	3113
22.5.1.4	Wake-Up Configuration	3113
22.5.1.5	MMC Host and Bus Configuration	3114
22.5.2	Basic Operations for MMC/SD/SDIO Host Controller	3115
22.5.2.1	Card Detection, Identification, and Selection	3116
22.5.2.2	Read/Write Transfer Flow in DMA Mode with Interrupt	3117
22.5.2.3	Read/Write Transfer Flow in DMA Mode with Polling	3118
22.5.2.4	Read/Write Transfer Flow without DMA with Polling	3120
22.5.2.5	Read/Write Transfer Flow in CE-ATA Mode	3121
22.5.2.6	Suspend-Resume Flow	3121
22.5.2.6.1	Suspend Flow	3121
22.5.2.6.2	Resume Flow	3122
22.5.2.7	Basic Operations - Steps Detailed	3123
22.5.2.7.1	Command Transfer Flow	3123
22.5.2.7.2	MMCHS Clock Frequency Change	3125
22.5.3	MMC/SD/SDIO1 Bus Voltage Selection	3126
22.6	MMC/SD/SDIO Use Cases and Tips	3127
22.6.1	MMCHS Controller Usage	3127
22.6.1.1	Overview	3127
22.6.1.2	Environment	3128
22.6.1.2.1	Command and Data Transfer Formats	3128
22.6.1.3	Programming Flow	3129
22.6.1.3.1	Initial Configuration	3129
22.6.1.3.2	MMC Card Identification	3132
22.6.1.3.3	MMC Bus Setting Change After Card Identification	3134
22.6.1.3.4	Reading the CSD Register of a MMC Card	3135
22.6.1.3.5	MMC Write Transfer	3137
22.6.1.3.6	MMC Read Transfer	3139
22.6.1.3.7	Dealing with High Capacity Cards	3139
22.7	MMC/SD/SDIO Register Manual	3141
22.7.1	MMC/SD/SDIO Instance Summary	3141
22.7.2	MMC/SD/SDIO Registers Mapping Summary	3141

23	High-Speed USB Host Subsystem and High-Speed USB OTG Controller	3179
23.1	High-Speed USB OTG Controller	3181
23.1.1	High-Speed USB OTG Controller Overview	3181
23.1.1.1	Main Features	3181
23.1.2	High-Speed USB OTG Controller Environment	3183
23.1.2.1	High-Speed USB Controller Functional Interfaces	3184
23.1.2.1.1	Basic High-Speed USB Controller Pins	3184
23.1.2.1.2	High-Speed USB Controller Interface Description	3184
23.1.3	High-Speed USB OTG Controller Integration	3185
23.1.3.1	Clocking, Reset, and Power-Management Scheme	3185
23.1.3.1.1	Clocks	3185
23.1.3.1.2	Resets	3186
23.1.3.1.3	Power-Management Scheme	3186
23.1.3.1.4	Power Domain	3189
23.1.3.2	Hardware Requests	3189
23.1.3.2.1	Interrupt Requests	3189
23.1.3.2.2	IDLE Handshake Protocol	3190
23.1.3.2.3	MSTANDBY Handshake Protocol	3190

24	General-Purpose Interface	3327
24.1	General-Purpose Interface Overview	3328
24.1.1	Global Features	3328
24.2	General-Purpose Interface Environment	3330
24.2.1	GPIO as a Keyboard Interface	3330

24.2.2	General-Purpose Interface Functional Interfaces	3332
24.2.2.1	General-Purpose Interface Pins	3332
24.3	General-Purpose Interface Integration	3333
24.3.1	Description	3333
24.3.1.1	Clocking, Reset, and Power-Management Scheme	3333
24.3.1.1.1	Clocking	3333
24.3.1.1.2	Reset	3334
24.3.1.1.3	Power Domain	3334
24.3.1.1.4	Power Management	3334
24.3.1.2	Hardware Requests	3337
24.3.1.2.1	Interrupt Requests	3337
24.4	General-Purpose Interface Functional Description	3340
24.4.1	Interrupt and Wake-Up Features	3341
24.4.1.1	Synchronous Path: Interrupt Request Generation	3341
24.4.1.2	Asynchronous Path: Wake-Up Request Generation	3342
24.4.1.3	Interrupt (or Wake-Up) Line Release	3343
24.5	General-Purpose Interface Basic Programming Model	3344
24.5.1	Power Saving by Grouping the Edge/Level Detection	3344
24.5.2	Set-and-Clear Instructions	3344
24.5.2.1	Description	3344
24.5.2.2	Clear Instruction	3344
24.5.2.2.1	Clear Registers Addresses	3344
24.5.2.2.2	Clear Instruction Example	3345
24.5.2.3	Set Instruction	3345
24.5.2.3.1	Set Registers Addresses	3345
24.5.2.3.2	Set Instruction Example	3345
24.5.3	Interrupt and Wakeup	3346
24.5.3.1	Involved Configuration Registers	3346
24.5.3.2	Description	3347
24.5.4	Data Input (Capture)/Output (Drive)	3348
24.5.5	Debouncing Time	3349
24.6	General-Purpose Interface Register Manual	3350
24.6.1	General-Purpose Interface Register Mapping Summary	3350
24.6.2	Register Descriptions	3352
25	Initialization	3369
25.1	Initialization Overview	3370
25.1.1	Terminology	3370
25.1.2	Initialization Process	3370
25.2	Preinitialization	3371
25.2.1	Power Connections	3371
25.2.2	Clock and Reset	3373
25.2.2.1	Clock and Reset Overview	3373
25.2.2.2	Clock Configuration	3374
25.2.2.2.1	Required System Input Clocks	3374
25.2.2.2.2	Optional System Input Clock: sys_altclk	3375
25.2.2.2.3	Optional System Output Clock: sys_clkout1 and sys_clkout2	3375
25.2.2.3	Reset Configuration	3375
25.2.3	Boot Configuration	3376
25.3	Power, Clocks, and Reset Power-Up Sequence	3380
25.4	Device Initialization by ROM Code	3380
25.4.1	Bootting Overview	3380
25.4.1.1	Bootting Types	3380
25.4.1.2	Main Features	3381

25.4.2	Memory Map	3383
25.4.2.1	ROM Memory Map	3383
25.4.2.2	RAM Memory Map	3384
25.4.3	Overall Booting Sequence	3387
25.4.4	Startup and Configuration	3388
25.4.4.1	Startup	3388
25.4.4.2	Clocking Configuration	3388
25.4.4.3	Booting Device List Setup	3389
25.4.4.4	Software Booting Configuration	3390
25.4.5	Peripheral Booting	3392
25.4.5.1	Overview	3392
25.4.5.2	UART	3395
25.4.5.3	USB	3395
25.4.5.3.1	USB Driver Descriptors	3395
25.4.5.3.2	USB Customized Descriptors	3398
25.4.5.3.3	USB Driver Functionality	3399
25.4.6	Fast External Booting	3400
25.4.6.1	Overview	3400
25.4.6.2	External Booting	3400
25.4.7	Memory Booting	3401
25.4.7.1	Overview	3401
25.4.7.2	Non-XIP Memory	3402
25.4.7.3	XIP Memory	3404
25.4.7.3.1	GPMC Initialization	3404
25.4.7.4	NAND	3405
25.4.7.4.1	Initialization and NAND Detection	3405
25.4.7.4.2	SLC NAND Read Sector Procedure	3412
25.4.7.4.3	MLC NAND Read Sector Procedure	3414
25.4.7.5	OneNAND/Flex-OneNAND	3416
25.4.7.5.1	Initialization and OneNAND/Flex-OneNAND Detection	3416
25.4.7.5.2	OneNAND/Flex-OneNAND Read Sector Procedure	3417
25.4.7.5.3	OneNAND/Flex-OneNAND Support Limitations	3417
25.4.7.6	MMC/SD Cards	3418
25.4.7.6.1	Connectivity Constraints	3419
25.4.7.6.2	Initialization and MMC/SD Card Detection	3421
25.4.7.6.3	Read Sector Procedure	3422
25.4.7.6.4	File System Handling	3423
25.4.7.7	DiskOnChip	3429
25.4.8	Image Format	3429
25.4.8.1	Overview	3429
25.4.8.2	CH	3430
25.4.8.2.1	CHSETTINGS	3431
25.4.8.2.2	CHRAM	3432
25.4.8.2.3	CHFLASH	3433
25.4.8.2.4	CHMMCSO	3434
25.4.8.3	Image Format for GP Devices	3435
25.4.8.4	Image Execution	3435
25.4.9	Tracing	3436
25.5	Wake-Up Booting by ROM Code	3437
25.6	Debug Configuration	3441
25.6.1	Overview	3441
25.6.2	JTAG Port Signal Description	3441
25.6.3	Initial Scan Chain Configuration	3441

25.6.4	Adding TAPs to the Scan Chain	3442
25.6.5	Debugger Address Space	3443
A	Glossary	3445

11-84. CS Start and End Address Configuration Example	1270

11-85. OCM Subsystem Overview	1304
11-86. OCM Subsystem Integration to the Device	1305
12-1. Camera ISP Highlight	1309
12-2. Parallel Interface in Generic Configuration.....	1315
12-3. Parallel Interface in ITU-R BT.656 Configuration	1316
12-4. CSI2, CSI1 Serial Interface Configuration.....	1317
12-5. Synchronization Signals and Frame Timing in SYNC Mode.....	1318
12-6. Synchronization Signals and Data Timing in SYNC Mode.....	1318
12-7. SYNC Mode Clock Gating.....	1319
12-8. JPEG Stream Timing Diagrams	1319
12-9. Data Timing With Embedded Synchronization Signals (8-Bit Case)	1320
12-10. CSI1 Receiver Configuration Interface Signals.....	1322
12-11. Example of 0xFF00 0002 Transmission.....	1324
12-12. YUV422 Big Endian	1325
12-13. YUV422 Little Endian	1326
12-14. YUV420	1327
12-15. RGB888.....	1328
12-16. RGB565.....	1329
12-17. RGB444.....	1329
12-18. RAW8	1330
12-19. RAW10.....	1331
12-20. RAW12.....	1332
12-21. JPEG8 and JPEG8 FSP	1333
12-22. Two Data-Lane Merger Configuration	1334
12-23. One Data-Lane Configuration.....	1335
12-24. CSI2 Protocol Layer With Short and Long Packets.....	1335
12-25. Short Packet Structure	1336
12-26. Long Packet Structure	1337
12-27. Data Identifier Structure	1337
12-28. Virtual Channel	1338
12-29. General Frame Structure (Informative)	1340
12-30. Digital Interlaced Video Frame (Informative).....	1341
12-31. YUV420 8-Bit.....	1342
12-32. YUV420 10-Bit	1343
12-33. YUV420 8-Bit Legacy	1344
12-34. YUV420 8-Bit + CSPS	1345
12-35. YUV420 10-Bit + CSPS.....	1346
12-36. YUV422 8-Bit.....	1347
12-37. YUV422 10-Bit	1347
12-38. RGB565.....	1348
12-39. RGB888.....	1349
12-40. RGB666.....	1350
12-41. RGB444.....	1351
12-42. RGB555.....	1351
12-43. RAW6	1352
12-44. RAW7	1353
12-45. RAW8	1354
12-46. RAW10.....	1355
12-47. RAW12.....	1356

12-48. RAW14.....	1357
12-49. JPEG8	1358
12-50. Camera ISP Integration.....	1359
12-51. Clock Tree	1360
12-52. Interrupt Generation Tree	1364
12-53. Camera ISP Block Diagram.....	1371
12-54. Camera ISP/Data Path/RAW RGB Images	1373
12-55. Camera ISP/Data Path/YUV4:2:2 Images	1374
12-56. Camera ISP/Data Path/JPEG Images	1374
12-57. CSI1 Receiver Block Diagram	1375
12-58. Synchronization State-Machine.....	1377
12-59. CSI1 Frame Structure: Non-JPEG Data Format	1378
12-60. Frame Structure: JPEG8 Data Format	1378
12-61. CSI1 Data Structure.....	1379
12-62. CSI2 Receiver Block Diagram	1381
12-63. SHORT_PACKET Field Format	1383
12-64. Virtual Channel to Context	1384
12-65. Pixel Data Destination Setting in Progressive and Interlaced Mode.....	1386
12-66. Complex I/O Overview	1386
12-67. Complex I/O Power FSM	1387
12-68. RxMode and StopState FSM	1387
12-69. Timing-Control Module.....	1388
12-70. Control-Signal Generation.....	1389
12-71. Use of cam_global_reset With Global Reset Release Camera Modules	1391
12-72. CCDC Block Diagram.....	1394
12-73. Optical Clamp Representation	1397
12-74. Data Formatter Conversion Area Selection	1399
12-75. CCDC/Culling: Example for Decimation Pattern	1402
12-76. A-Law Table.....	1403
12-77. CCDC/Line-Output Control: Sample Formats of Input and Output Images.....	1405
12-78. Preview Engine Block Diagram.....	1408
12-79. Horizontal Distances for Different Patterns	1409
12-80. Resizer Process	1415
12-81. Resizer in Memory-Input Mode	1416
12-82. Typical Sample-Rate Converter	1417
12-83. Resizer Functionality	1417
12-84. Resizer Approximation Scheme	1417
12-85. Cutoff Frequency for Low-Pass Filter.....	1417
12-86. Alignment of Input Pixels to Tap Coefficients.....	1419
12-87. Pseudo-Code Description of the Resizer Algorithm in the 4-Tap/8-Phase Mode.....	1420
12-88. Pseudo-Code Description of the Resizer Algorithm in the 7-Tap/4-Phase Mode.....	1421
12-89. Histogram Process	1427
12-90. Color Pattern Index	1428
12-91. Region Priority	1429
12-92. Central-Resource SBL Block Diagram.....	1430
12-93. Single Slice Buffer (Write Mode)	1434
12-94. Single Slice Buffer Example (Write Mode)	1435
12-95. Circular Buffer Control Feedback Loop Example	1437
12-96. Extended Slice Buffer Example.....	1438

12-97. CSI1_CTRL .VP_CLK_POL Settings	1448
12-98. SOF and EOF Region Settings	1449
12-99. Pixel Data Region Settings.....	1450
12-100. Pixel Data Destination Settings	1452
12-101. CSI2 Receiver Global Reset Flow Chart.....	1453
12-102. cam_strobe Signal-Generation for Red-Eye Removal	1459
12-103. Dependencies Among Framing Settings in Data Flow	1463
12-104. CCDC_VD0_IRQ/CCDC_VD1_IRQ Interrupt Behavior When VDPOL = 0	1465
12-105. CCDC_VD0_IRQ/CCDC_VD1_IRQ Interrupt Behavior When VDPOL = 1	1465
12-106. CCDC_VD2_IRQ Interrupt Behavior	1465
12-107. HS/VS Sync Pulse Output Timings	1468
12-108. Mosaic Filter - CCDC_COLPTN Bit Field Settings	1469
12-109. Data Packing - Pixel Ordering	1474
12-110. Clipping Window Before Output to Memory	1475
12-111. Firmware Interactions for Memory-Input Resizing	1482
12-112. Video-Port Interface Bandwidth Balancing	1493
12-113. Memory Read Bandwidth Balancing.....	1494
13-1. Graphics Accelerator Highlight	1738
13-2. SGX Subsystem Integration.....	1741
13-3. SGX Block Diagram.....	1743
14-1. IVA2.2 Subsystem Highlight	1746
14-2. IVA2.2 Subsystem Integration	1748
14-3. IVA2.2 Subsystem Resets	1750
14-4. IVA2.2 Power Domain	1752
14-5. IVA2.2 EDMA Requests	1753
14-6. IVA2.2 Interrupt Management	1755
14-7. IVA2.2 Subsystem Block Diagram	1758
14-8. DSP Megamodule Block Diagram.....	1759
14-9. DSP Megamodule INTC Block Diagram	1763
14-10. Interrupt Selector Block Diagram.....	1765
14-11. IVA2.2 EDMA Overview	1768
14-12. TPCC Block Diagram	1769
14-13. DMA/QDMA Channel Mapping and PaRAM Entry.....	1771
14-14. TPTC Block Diagram.....	1774
14-15. Transfer Geometry	1775
14-16. IVA2.2 MMU Block Diagram	1779
14-17. IVA2.2 MMU Translation Table Hierarchy.....	1780
14-18. Sequencer Block Diagram.....	1781
14-19. Sequencer Memory Mapping	1784
14-20. iLF/iME Execution State-Machine	1786
14-21. iLF/iME Instruction Sequence Format in L2 Memory	1791
14-22. iLF Overview	1792
14-23. iLF Stack Parameter Format.....	1797
14-24. iLF Pixel Format in L2 Memory	1803
14-25. iLF Internal Pixel Format	1803
14-26. iLF Edge Numbering	1804
14-27. iME Overview	1805
14-28. iME Pixel Format in L2.....	1819
14-29. SL2 Memory Interface Block Diagram	1822

14-30. IVA2.2 WUGEN Description	1824
14-31. WUGEN Event Generation.....	1825
14-32. WUGEN Event Masking	1826
14-33. WUGEN Event Mask Clear	1827
14-34. SYSC Block Diagram	1828
14-35. IVA2.2 Local Memories Hierarchy.....	1831
14-36. IVA2 Boot Mode Configuration	1834
14-37. IVA2 Boot Basic Programming Model	1838
14-38. iME/iLF Typical Use Flowchart	1862
14-39. IVA2.2 Interrupt Flow	1864
14-40. Process of Identifying Source Event of an Interrupt	1870
14-41. L1P Memory Protection Registers	1871
14-42. L1D Memory Protection Registers	1872
14-43. L2 Memory Protection Registers	1873
14-44. IVA2 Power Off	1882
14-45. IVA2 Power Down	1883
14-46. IVA2 Wake Up	1884
15-1. Display Subsystem Highlight.....	2133
15-2. LCD Support Parallel Interface (RFBI Mode)	2138
15-3. External Generation of TE Signal Based on Logical OR Operation Between HSYNC and VSYNC (Active-High)	2139
15-4. LCD Support Parallel Interface (Bypass Mode)	2140
15-5. LCD Pixel Data Monochrome4 Passive Matrix	2141
15-6. LCD Pixel Data Monochrome8 Passive Matrix	2142
15-7. LCD Pixel Data Color Passive Matrix.....	2142
15-8. LCD Pixel Data Color12 Active Matrix	2143
15-9. LCD Pixel Data Color16 Active Matrix	2144
15-10. LCD Pixel Data Color18 Active Matrix	2144
15-11. LCD Pixel Data Color24 Active Matrix	2145
15-12. RFBI Data Stall Signal Diagram	2145
15-13. RFBI Data Stall Signal Diagram With Handcheck	2146
15-14. Command Data Write	2146
15-15. Display Data Read	2147
15-16. Read to Write and Write to Read.....	2148
15-17. Active Matrix Timing Diagram of Configuration 1 (Start of Frame)	2149
15-18. Active Matrix Timing Diagram of Configuration 1 (Between Lines)	2149
15-19. Active Matrix Timing Diagram of Configuration 1 (Between Frames)	2149
15-20. Active Matrix Timing Diagram of Configuration 1 (End of Frame)	2149
15-21. Active Matrix Timing Diagram of Configuration 2 (Start of Frame)	2150
15-22. Active Matrix Timing Diagram of Configuration 2 (Between Lines)	2150
15-23. Active Matrix Timing Diagram of Configuration 2 (Between Frames)	2150
15-24. Active Matrix Timing Diagram of Configuration 2 (End of Frame)	2150
15-25. Active Matrix Timing Diagram of Configuration 3 (Start of Frame)	2151
15-26. Active Matrix Timing Diagram of Configuration 3 (Between Lines)	2151
15-27. Active Matrix Timing Diagram of Configuration 3 (Between Frames)	2151
15-28. Active Matrix Timing Diagram of Configuration 3 (End of Frame)	2151
15-29. Passive Matrix Timing Diagram (Start of Frame)	2152
15-30. Passive Matrix Timing Diagram (Between Lines)	2152
15-31. Passive Matrix Timing Diagram (Between Frames)	2152

15-32. Passive Matrix Timing Diagram (End of Frame)	2152
15-33. Typical SDI Connection.....	2153
15-34. Typical DSI Connection.....	2155
15-35. DSI Video Mode Without Burst (No-Line Buffer)	2160
15-36. DSI Video Mode Without Burst (One-Line Buffer)	2161
15-37. DSI Video Mode With Burst (Two-Line Buffers).....	2162
15-38. Stall Timing With Pixel on Rising Edge.....	2163
15-39. Stall Timing With Pixel on Falling Edge	2163
15-40. Data Flow in Command Mode Using the Video Port	2164
15-41. Two Data Lane Configuration.....	2166
15-42. One Data Lane Configuration.....	2166
15-43. Two Packets Using Two-Data Lane Configuration (Example)	2166
15-44. Protocol Layer With Short and Long Packets.....	2167
15-45. Short Packet Structure.....	2167
15-46. Long Packet Structure	2168
15-47. Data Identifier Structure	2169
15-48. Virtual Channel Controller	2169
15-49. DSI Video Mode: Nonburst Transfer With VE and HE	2172
15-50. DSI Video Mode: Nonburst Transfer Without VE and HE.....	2173
15-51. DSI Video Mode: Burst Transfer Without VE and HE	2174
15-52. DSI General Frame Structure.....	2175
15-53. DSI General Frame Structure Using Burst Mode	2176
15-54. DSI General Frame Structure Using Burst Mode and Interleaving	2177
15-55. 24 Bits per Pixel RGB Color Format, Long Packet	2179
15-56. 18 Bits per Pixel (Loosely Packed) RGB Color Format.....	2180
15-57. 18 Bits per Pixel (Packed) RGB Color Format.....	2181
15-58. 16 Bits per Pixel RGB Color Format, Long Packet	2182
15-59. 24 Bits Per Pixel With One Data Channel.....	2183
15-60. 24 Bits Per Pixel With Two Data Channels	2183
15-61. 24 Bits Per Pixel With Three Data Channels	2183
15-62. TV Display Interface (s-video mode).....	2184
15-63. TV Display Interface (Composite Mode)	2185
15-64. Display Subsystem Integration	2188
15-65. Display Subsystem Clock Tree	2189
15-66. Display Subsystem DMA Tree.....	2198
15-67. DSI Interrupt Tree	2199
15-68. DISPC and DSS Interrupts Tree	2200
15-69. Display Subsystem Full Schematic	2204
15-70. Display Controller Architecture Overview	2205
15-71. Palette/Gamma Correction Architecture.....	2209
15-72. YCbCr 4:2:2 to YCbCr 4:4:4 (0- or 180-Degree Rotation)	2212
15-73. YCbCr 4:2:2 to YCbCr 4:4:4 (90- or 270-Degree Rotation).....	2212
15-74. Interpolation of the Missing Chrominance Component	2212
15-75. YCbCr to RGB Registers (VIDFULLRANGE=0).....	2213
15-76. YCbCr to RGB Registers (VIDFULLRANGE=1).....	2213
15-77. Color Space Conversion Macro-Architecture	2214
15-78. Video Upsampling	2215
15-79. Resampling Macro-Architecture (3-Coefficient Processing)	2216
15-80. Overlay Manager in Normal Mode	2218

15-81. Display Attributes in Normal Mode	2219
15-82. Overlay Manager in Alpha Mode	2220
15-83. Display Attributes in Alpha Mode	2220
15-84. Alpha Blending Macro Architecture	2221
15-85. Video Source Transparency Example	2223
15-86. Graphics Destination Transparency Example	2224
15-87. Color Phase Rotation Matrix	2225
15-88. Color Phase Rotation Macro Architecture.....	2225
15-89. DSI Protocol Engine.....	2228
15-90. DSI Transmitter/Receiver Data Flow.....	2229
15-91. LP to HS Timing	2230
15-92. HS to LP Timing	2231
15-93. HS Command Mode Interleaving.....	2236
15-94. LP Command Mode Interleaving	2238
15-95. Complex I/O Power FSM	2241
15-96. DSI PLL Power FSM	2242
15-97. DSI PLL HS Clock FSM	2244
15-98. ForceTxStopMode FSM	2245
15-99. TurnRequest FSM.....	2246
15-100. High-Speed TX Timer FSM.....	2247
15-101. Low-Power RX Timer FSM	2248
15-102. 64-Bit ECC Generation on TX Side.....	2252
15-103. Checksum Transmission	2252
15-104. 16 Bit CRC Generation Using a Shift Register.....	2253
15-105. DSI PLL Controller Overview	2254
15-106. DSI PLL Reference Diagram	2255
15-107. DSI Complex I/O Architecture	2257
15-108. RFBI Architecture Overview	2258
15-109. Video Encoder Architecture Overview.....	2261
15-110. Closed Captioning Timing.....	2264
15-111. WSS Timing.....	2266
15-112. Dual 10-Bit Video DAC Architecture.....	2267
15-113. DC-Coupling TV Detect Waveforms for TV Connected and Disconnected	2270
15-114. AC-Coupling TV Detect Waveforms for TV Connected and Disconnected	2270
15-115. GPIO Signal Waveform Proposal for TV Detection/Disconnection in DC-Coupling Mode	2271
15-116. GPIO Signal Waveform Proposal for TV Detection/Disconnection in AC-Coupling Mode	2271
15-117. DAC Test Mode in Composite Video Mode	2272
15-118. DAC Test Mode in Separate video Mode.....	2273
15-119. SDI Architecture Overview.....	2274
15-120. Overlay Optimization: Case 1	2280
15-121. Overlay Optimization: Case 2	2281
15-122. Overlay Optimization: Case 3	2281
15-123. Overlay Optimization: Case 4	2282
15-124. 90° DMA Rotation Example.....	2288
15-125. Rotation/Mirroring Settings.....	2291
15-126. 90° Rotation With Mirroring	2292
15-127. Offset for VRFB Rotation.....	2294
15-128. Offset for VRFB Rotation With Mirroring	2296
15-129. Timing Values Description (Active Matrix Display)	2298

15-130. PCDmin Formulas (V Down-Sampling Only)	2300
15-131. Color Phase Rotation Matrix.....	2302
15-132. Color Phase Rotation Matrix (R Component Only)	2302
15-133. Color Phase Rotation Matrix (G Component Only)	2302
15-134. Color Phase Rotation Matrix (B Component Only)	2302
15-135. Diagonal Matrix Configuration	2303
15-136. Example - Diagonal Matrix Configuration	2303
15-137. Image With and Without CPR (Diagonal Matrix).....	2304
15-138. Example - Image With and Without CPR (Standard Matrix)	2305
15-139. DSI PLL Programming Blocks.....	2319
15-140. DSI PLL Go Sequence (Manual Mode)	2320
15-141. DSI PLL Go Sequence (Automatic Mode)	2321
15-142. Gated Mode Sequence.....	2322
15-143. DSI PLL Programming Sequence.....	2324
15-144. High-Speed Clock Transmission	2328
15-145. High-Speed Data Transmission	2330
15-146. Turn-Around Request in Transmit Mode.....	2331
15-147. Turn-Around Request in Receive Mode.....	2332
15-148. How to Use RFBI.....	2340
15-149. RFBI Initial Configuration	2341
15-150. RFBI Output Enable	2342
15-151. SDI Start Sequence.....	2348
15-152. SDI Stop Sequence.....	2349
15-153. SDI Clock Source/Frequency Change Sequence Part A	2350
15-154. SDI Clock Source/Frequency Change Sequence Part B	2351
15-155. Vertical Filtering Macro Architecture (Three Taps)	2353
15-156. Vertical Filtering Macro Architecture (Five Taps)	2354
15-157. Horizontal Filtering Macro Architecture (Five Taps)	2355
15-158. Vertical Up-/Down-Sampling Algorithm	2356
15-159. Horizontal Up-/Down-Sampling Algorithm	2357
15-160. QVGA LCD Timings	2368
15-161. SDI PLL Architecture	2369
15-162. Main Flowchart	2370
15-163. Flowchart SDI 1-Data Pair	2371
15-164. Flowchart SDI 2-Data Pairs.....	2372
15-165. Flowchart SDI 3-Data Pairs.....	2373
15-166. HVGA Display	2374
15-167. Hardware Connections for FlatLink3G Application	2376
15-168. SN65LVDS302 Receiver Modes and Transitions.....	2379
15-169. Overview	2381
15-170. Environment	2381
15-171. Display Subsystem Data Flow.....	2382
15-172. Display Controller Data Flow	2383
15-173. Display Panel Configuration for the Camcorder Use Case.....	2383
15-174. Display Subsystem Configuration for Camcorder Use Case.....	2384
15-175. Display Subsystem Initialization.....	2385
15-176. Software Reset Flowchart.....	2386
15-177. Display Panel Configuration Flowchart.....	2391
15-178. QVGA LCD Panel Timings.....	2392

15-179. DSI Clock Tree in Video Mode	2394
15-180. Overview	2398
15-181. Overview	2405
16-1. Timers.....	2570
16-2. GP Timers Overview	2571
16-3. GP Timers External System Interface	2573
16-4. GP Timer Integration.....	2574
16-5. Wake-Up Request Generation.....	2578
16-6. Block Diagram of GPTIMER3 through GPTIMER9 and GPTIMER11.....	2581
16-7. Block Diagram of GPTIMER1, GPTIMER2, and GPTIMER10	2582
16-8. GPTi.TCRR Timing Value	2583
16-9. Block Diagram of the 1-ms Tick Module.....	2584
16-10. Capture Wave Example for GPTi.TCLR[13] CAPT_MODE = 0.....	2586
16-11. Capture Wave Example for GPTi.TCLR[13] CAPT_MODE = 1	2586
16-12. Timing Diagram of PWM With GPTi.TCLR[7] SCPWM Bit = 0.....	2588
16-13. Timing Diagram of PWM With GPTi.TCLR[7] SCPWM Bit = 1.....	2588
16-14. WDTs Block Diagram	2617

15-29. 8-Bit Interface Configuration/24-Bit Mode	2227
15-30. Maximum Width Allowed	2227
15-31. LP to HS Timing Parameters	2230
15-32. HS to LP Timing Parameters	2232
15-33. Extra NULL Packet Header	2232
15-34. Extra NULL Packet Payload	2233
15-35. DSI PLL Operation Modes When Not Locked	2255
15-36. 16-Bit Interface Configuration/24-Bit Mode	2259
15-37. Read/Write Function Description	2260
15-38. Minimum Cycle Time for CSx/WE Always Asserted	2260
15-39. 100/100 Color Bar Table	2261
15-40. VENC_S_CARR Register Recommended Values	2262
15-41. Closed-Caption Data Format	2263
15-42. Closed-Caption Run Clock Frequency Settings	2264
15-43. Closed-Caption Standard Timing Values	2264
15-44. Wide-Screen Signaling Run Clock Frequency Settings	2265
15-45. Shadow Registers	2276
15-46. Vertical/Horizontal Accumulator Phase	2286
15-47. Color Space Conversion Register Values	2287
15-48. 90-degree DMA Rotation Example Description	2289
15-49. DMA Rotation Register Settings	2291
15-50. Video Rotation Register Settings (With RGB24 Packet Format)	2292
15-51. Register Settings for DMA Rotation With Mirroring	2293
15-52. VRFB Rotation - DMA Settings	2293
15-53. VRFB Rotation With Mirroring - DMA Settings	2295
15-54. Video Rotation Register Settings (YUV Only)	2296
15-55. Video Rotation With Mirroring Register Settings (YUV only)	2297
15-56. Programming Rules	2298
15-57. Pixel Clock Frequency Limitations - RGB16 and YUV422 Active Matrix Display	2299
15-58. Pixel Clock Frequency Limitations - RGB16 and YUV422 Passive Matrix Display - Mono4	2299
15-59. Pixel Clock Frequency Limitations - RGB16 and YUV422 Passive Matrix Display - Mono8	2299
15-60. Pixel Clock Frequency Limitations - RGB16 and YUV422 Passive Matrix Display - Color	2300
15-61. Register Access Width Limitations	2307
15-62. Virtual Channel TX FIFO Size Values	2311
15-63. Virtual Channel TX FIFO Start Address	2312
15-64. Virtual Channel RX FIFO Size Values	2313
15-65. Virtual Channel RX FIFO Start Address	2313
15-66. Recommended Programming Values	2326
15-67. RFBI Behavior	2334
15-68. RFBI Timings Configuration	2338
15-69. Video Encoder Register Programming Values	2343
15-70. PLL Divisor Example Values for TI FlatLink3G	2345
15-71. SDI Pixel Data Format	2346
15-72. Vertical FIR Coefficients Corresponding Table (3-Tap Configuration)	2357
15-73. Vertical FIR Coefficients Corresponding Table (5-Tap Configuration)	2358
15-74. Horizontal FIR Coefficients Corresponding Table (5-Tap Configuration)	2358
15-75. Vertical/Horizontal Accumulator Phase	2360

15-76. Up-Sampling Vertical Filter Coefficients (Three Taps)	2361
15-77. Up-Sampling Vertical Filter Coefficients (Five Taps)	2361
15-78. Up-Sampling Horizontal Filter Coefficients (Five Taps)	2361
15-79. Down-Sampling Vertical Filter Coefficients (Three Taps)	2362
15-80. Down-Sampling Vertical Filter Coefficients (Five Taps)	2363
15-81. Down-Sampling Horizontal Filter Coefficients (Five Taps)	2363
15-82. SN65LVDS302 Receiver Mode Transitions	2380
15-83. Registers Print for QVGA LCD panel Pads Multiplexing Configuration	2384
15-84. Registers Print for Display Subsystem Clock Management	2386
15-85. Registers Print for Display Subsystem Power Management	2386
15-86. Registers Print for Display Subsystem Software Reset	2387
15-87. VRFB Rotation Configuration	2388
15-88. VRFB Rotation Configuration for a VGA Display (UYVY format)	2388
15-89. Video Rotation Register Settings (UYVY Only)	2389
15-90. Registers Print for Video1 Channel Configuration	2389
15-91. Registers Print for Interrupts Enable	2390

Survey

Help us meet your expectations:

We are always looking at ways to develop our service and improve our quality to fit your needs. Please take a few minutes to complete our short questionnaire by:

- Providing general suggestions
or
- Rating a document and describing its critical points

About This Manual

FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

Information About Cautions and Warnings

This book may contain cautions and warnings.

CAUTION

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

WARNING

This is an example of a warning statement.

A warning statement describes a situation that could potentially cause harm to you.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

Register, Field, and Bit Calls

The naming convention applied for a call consists of:

- For a register call: *<Module name>.<Register name>*; for example: UART.UASR
- For a bit field call:
 - *<Module name>.<Register name>[End:Start] <Field name> field*; for example, UART.UASR[4:0] SPEED bit field
 - *<Field name> field <Module name>.<Register name>[End:Start]*; for example, SPEED bit field UART.UASR[4:0]
- For a bit call:
 - *<Module name>.<Register name>[pos] <Bit name> bit*, for example, UART.UASR[5] BIT_BY_CHAR bit
 - *<Bit name> bit <Module name>.<Register name>[pos]*; for example, BIT_BY_CHAR bit UART.UASR[5]

To help the reader navigate the document, each register call is hyperlinked to its register description in the register manual section. After each register description, a table summarizes all hyperlinked register calls.

To navigate in the PDF documents, see [Acrobat Reader Tips](#).

Coding Rules

The programming models or code listings follow the rules:

Type	Definition	Example
File	Starts with the module name	PRCM_test1.c MCBSP1_init.h
Variable	Global variables are prefixed by "g_" Pointers are prefixed by "p" Global pointers are prefixed by "g_p"	g_SDMA_LogicalChan pAddrCounter g_pSDMA_LogicalChan
Function	Starts with the module name	PRCM_SetupClocks() ArmIntC_MaskInterrupts()
Typedef	Ends with "_t"	PRCM_Struct_t
Definition	Starts with the module name and is followed by the register name	#define SMS_ERR_TYPE *((volatile Uint32*)0x680080F4) #define MCBSP2_RCR1_REG *((volatile Uint32*)0x4807401C)
Enumeration	Starts with the module name	Typedef enum DMA_Mode_Label { INPUT_MODE OUTPUT_MODE } DMA_Mode_t;

Flow Chart Rules

Flow charts follow the following rules:

Shape	Name	Definition
	Process	Any computational steps or processing function of a program; defined operation(s) causing change in value, form, or location of information
	Decision	A decision or switching type operation that determines which of a number of alternate paths is followed
	Predefined process or sub-process	One or more named operations or program steps specified in a subroutine or another set of flow charts
	Data or I/O	General I/O function; information available for processing (input) or recording of processed information (output)
	Terminator	Terminal point in a flow chart: start, stop, halt, delay, or interrupt; may show exit from a closed subroutine
	Annotation	Additional descriptive clarification, comment
	On page connector (reference)	Exit to, or entry from, another part of chart in the same page
	Off page connector (reference)	The flow continues on a different page.
	Summing Junction	Logical AND
	Or	Logical OR
	Parallel mode (ISO)	Beginning or end of two or more simultaneous operations
	Flow Line	Lines indicate the sequence of steps and the direction of flow.

Acrobat Reader Tips

Acrobat includes two methods to search for words in a PDF:

- The Find toolbar provides a basic set of options to locate a word in the current PDF.
- The Search window lists words or partial words that match your text in the current PDF.

These guidelines apply to Acrobat Reader 5.x, 6.0, and 7.0.

For more information on Acrobat Reader search features, see the Adobe Reader Help.

To search for words in a document using the Find dialog box:

1. Open the document.
2. To display the Find toolbar, right-click in the toolbar area and select Find.
3. In the Find box, type the word, words, or partial words for which you want to search.
4. From the Find Options menu, select options as desired.
5. To view each search result, click the Find toolbar, the Find Previous button, or the Find Next button to go backward or forward through the document.

To search for words in a document using the Search PDF window:

1. Open the document.
2. Click the Search button on the File toolbar or right-click on your document and select Search.
3. Type the word, words, or part of a word for which you want to search.
4. Click Search.
5. The results appear in page order and, if applicable, show a few words of context. Each result displays an icon to identify the type of occurrence. All other searchable areas display the Search Result icon.
6. To display the page that contains a search result, click an item in the Results list. The occurrence is highlighted.
7. To navigate to the next result, choose Edit > Search Results > Next Result (or Ctrl+G).
8. To navigate to the previous result, choose Edit > Search Results > Previous Result (or Shift+Ctrl+G).

Navigate through your previous view

To retrace your path within an Adobe PDF document:

- For the previous view: Choose View > Go To > Previous View or Alt+Left Arrow.
- For the next view: Choose View > Go To > Next View or Alt+Right Arrow. The Next View command is available only if you have chosen Previous View.

If you view the PDF document in a browser, use options on the Navigation toolbar to move between views.

- Right-click the toolbar area, and then choose *Navigation*.
- Click the Go To Previous View button or the Go To Next View button.

NOTE: This navigation tip is useful to return to your previous view after clicking on a register call hyperlink.

OMAP335xx Disclaimer

All programming models and use cases presented in this manual are provided for educative purposes only and may differ from or be optimized for your applications.

All OMAP peripheral devices presented in this manual are provided for illustration purposes and may be different from those in your system.

Introduction

This chapter introduces the features, supporting subsystems, and architecture of the OMAP35x high-performance applications processors.

Topic	Page
1.1 Overview	176
1.2 Environment	178
1.3 Description	179
1.4 Package-On-Package Concept	185
1.5 OMAP35x Family	188

1.1 Overview

The OMAP35x family of high-performance, applications processors are based on the enhanced OMAP™ 3 architecture and are integrated on TI's advanced 65-nm process technology.

NOTE: The OMAP 3 architecture is configured with different sets of features in different devices. This technical reference manual details all of the features available in current and future OMAP35x devices. Some features may not be available or supported in your particular device. For more information, see [Section 1.5, *OMAP35x Family*](#) and your device-specific data manual.

The architecture is designed to provide best-in-class video, image, and graphics processing sufficient to support the following:

- Streaming video
- 2D/3D mobile gaming
- Video conferencing
- High-resolution still image

The architecture of OMAP35xx is designed to provide maximum flexibility in a wide range of end applications including but not limited to:

- Portable Data Terminals
- Navigation
- Auto Infotainment
- Gaming
- Medical imaging
- Home Automation
- Human Interface
- Industrial Control
- Test and Measurement
- Single board Computers

The device can support numerous HLOS and RTOS solutions including Linux and Windows Embedded CE which are available directly from TI.

NOTE: This technical reference manual focuses only on general-purpose (GP) devices. To determine if a high-security (HS) version of your device is available and for more information on HS devices, see [Section 1.5, *OMAP35x Family*](#), and your device-specific data manual.

This OMAP device includes state-of-the-art power-management techniques required for high-performance mobile products.

The following subsystems are part of the device:

- Microprocessor unit (MPU) subsystem based on the ARM® Cortex™-A8 microprocessor
- IVA2.2 subsystem with a C64x+ digital signal processor (DSP) core
- POWERVR SGX™ Graphics Accelerator subsystem for 3D graphics acceleration to support display and gaming effects

NOTE: IVA2.2 and SGX are not available on all devices. See [Section 1.5, *OMAP35x Family*](#), for more information on available features.

- Camera image signal processor (ISP) that supports multiple formats and interfacing options connected to a wide variety of image sensors
- Display subsystem with a wide variety of features for multiple concurrent image manipulation, and a programmable interface supporting a wide variety of displays. The display subsystem also supports NTSC/PAL video out.

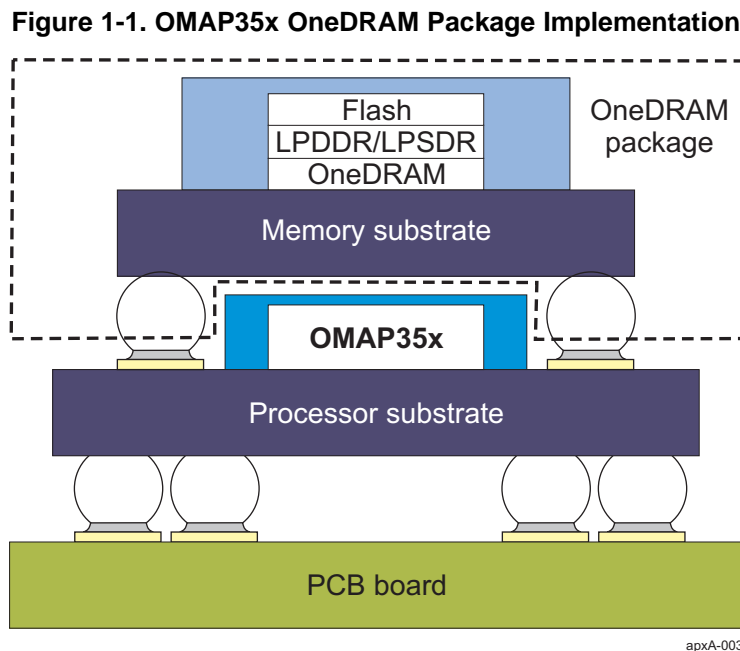

- Level 3 (L3) and level 4 (L4) interconnects that provide high-bandwidth data transfers for multiple initiatorSection 1.4s to the internal and external memory controllers and to on-chip peripherals

The device also offers:

- A comprehensive power and clock-management scheme that enables high-performance, low-power operation, and ultralow-power standby features. The device also supports SmartReflex™ adaptative voltage control. This power management technique for automatic control of the operating voltage of a module reduces the active power consumption.
- A memory stacking feature using the package-on-package (POP) implementation (see , *Package-on-Package Concept*)

1.1.1 OneDRAM Implementation

Figure 1-1 shows the OMAP35x OneDRAM implementation.

A maximum of three memory dies of LPDDR and/or the flash type can be assembled into a packaged memory device for the OMAP35x processor. The pads of the dies are connected to bottom balls that form the memory package footprint (balls of the memory substrate). Around the encapsulated dies, on the processor substrate, a TOP-BGA footprint matches the memory package footprint; the memory device is soldered onto the processor substrate. Some processor pads are connected to the TOP-BGA footprint and to the bottom balls. Other processor pads are connected to only the BOTTOM-BGA balls.

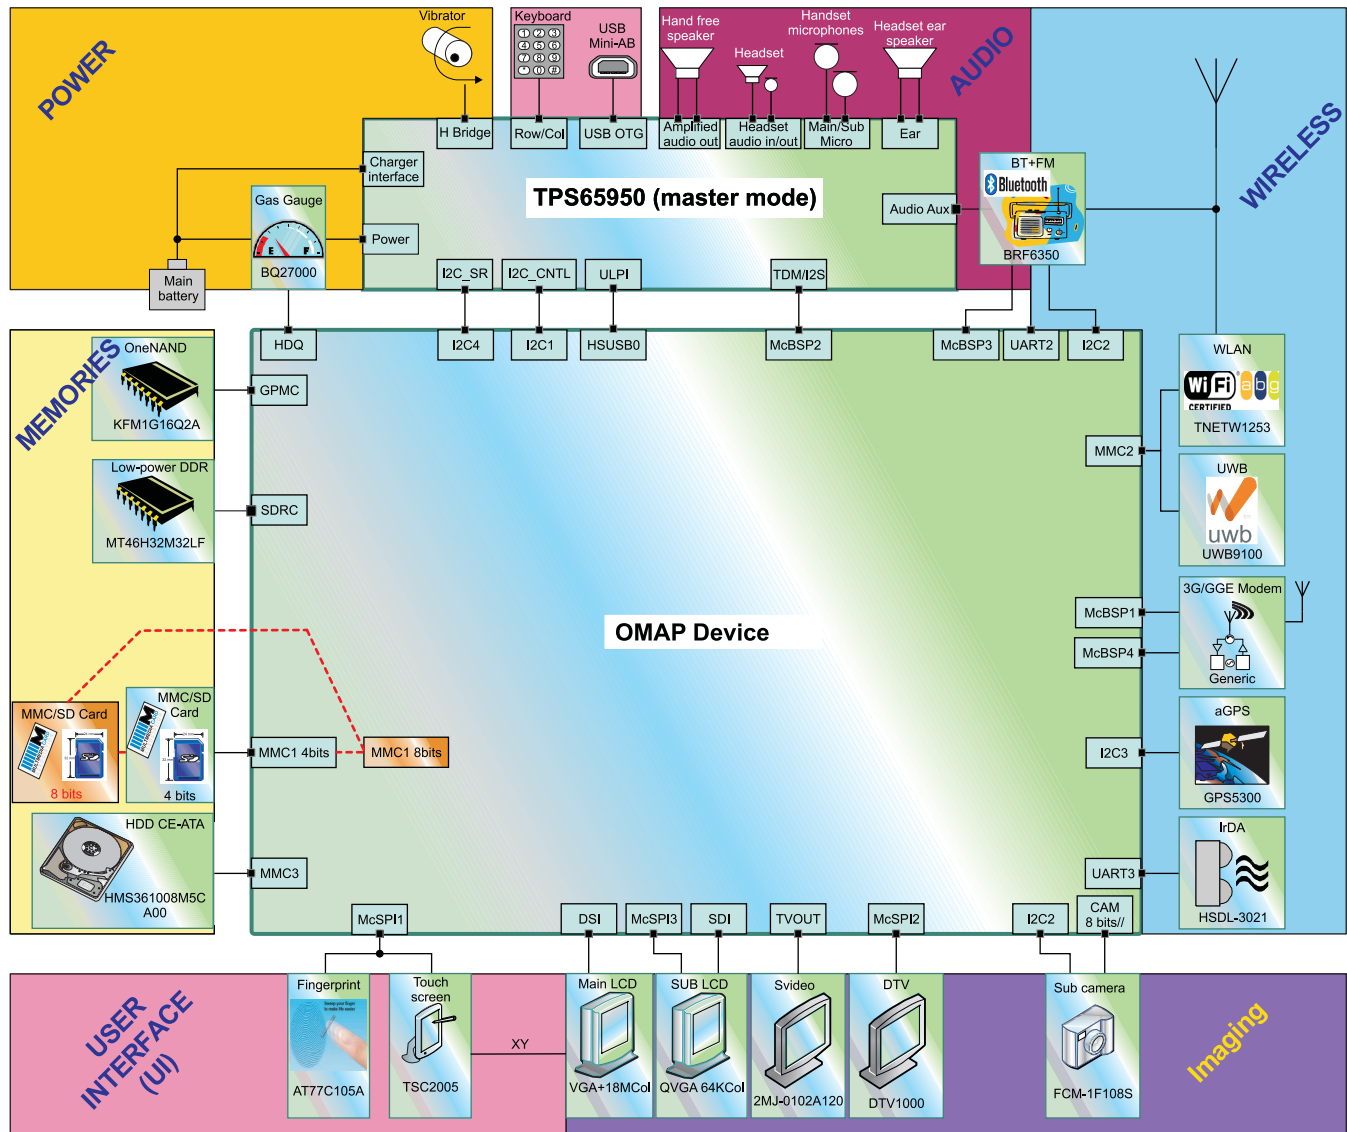

The memory device balls can be connected to the bottom balls using the feed-through (FT) pads of the processor substrate. The bottom balls form the BOTTOM-BGA processor package footprint. The BOTTOM-BGA footprint matches the PCB footprint to which the POP device is soldered on the board.

1.2 Environment

This section provides an overview of the OMAP environment. The device is associated with a power integrated circuit (IC). Texas Instruments provides a global solution with the TPS65950 device. For more information on the TPS65950 device, contact your TI representative.

Figure 1-2 provides an overview of a nonexhaustive environment for the high-tier OMAP35x device.

Figure 1-2. OMAP35x Environment Using TPS65950

108-001

NOTE: Some features are not available on all devices. See [Section 1.5, OMAP35x Family](#), for more information on available features.

1.3 Description

The device is offered in three packages:

- CBB package: 515-ball, 12 x 12 mm, package-on-package (POP) 0.5-mm (top) and 0.4-mm (bottom) ball pitch package. Some balls are available at the top of the device to allow memory stacking. For more information, see [Section 1.4, Package-on-Package Concept](#).
- CBC package: 515-ball, 14 x 14 mm, package-on-package (POP) 0.65-mm (top) and 0.5-mm (bottom) ball pitch package. Some balls are available at the top of the device to allow memory stacking. For more information, see [Section 1.4, Package-on-Package Concept](#).
- CUS package: 423-ball, 16 x 16mm, 0.65-mm (bottom) ball pitch package

Figure 1-3 and Figure 1-4 shows the block diagram.

Figure 1-3. 3515/03 Block Diagram

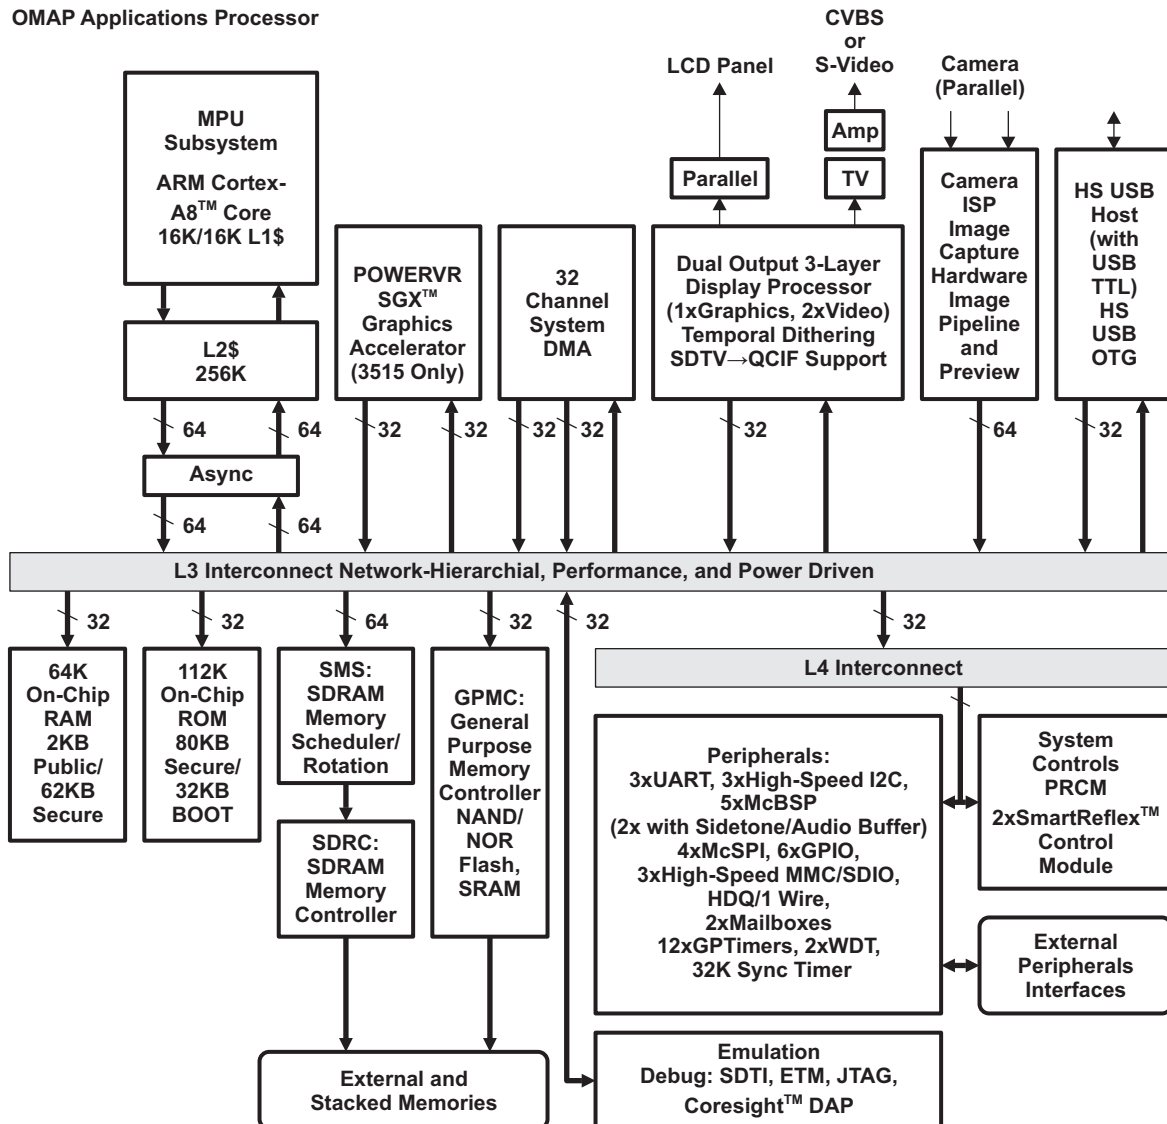

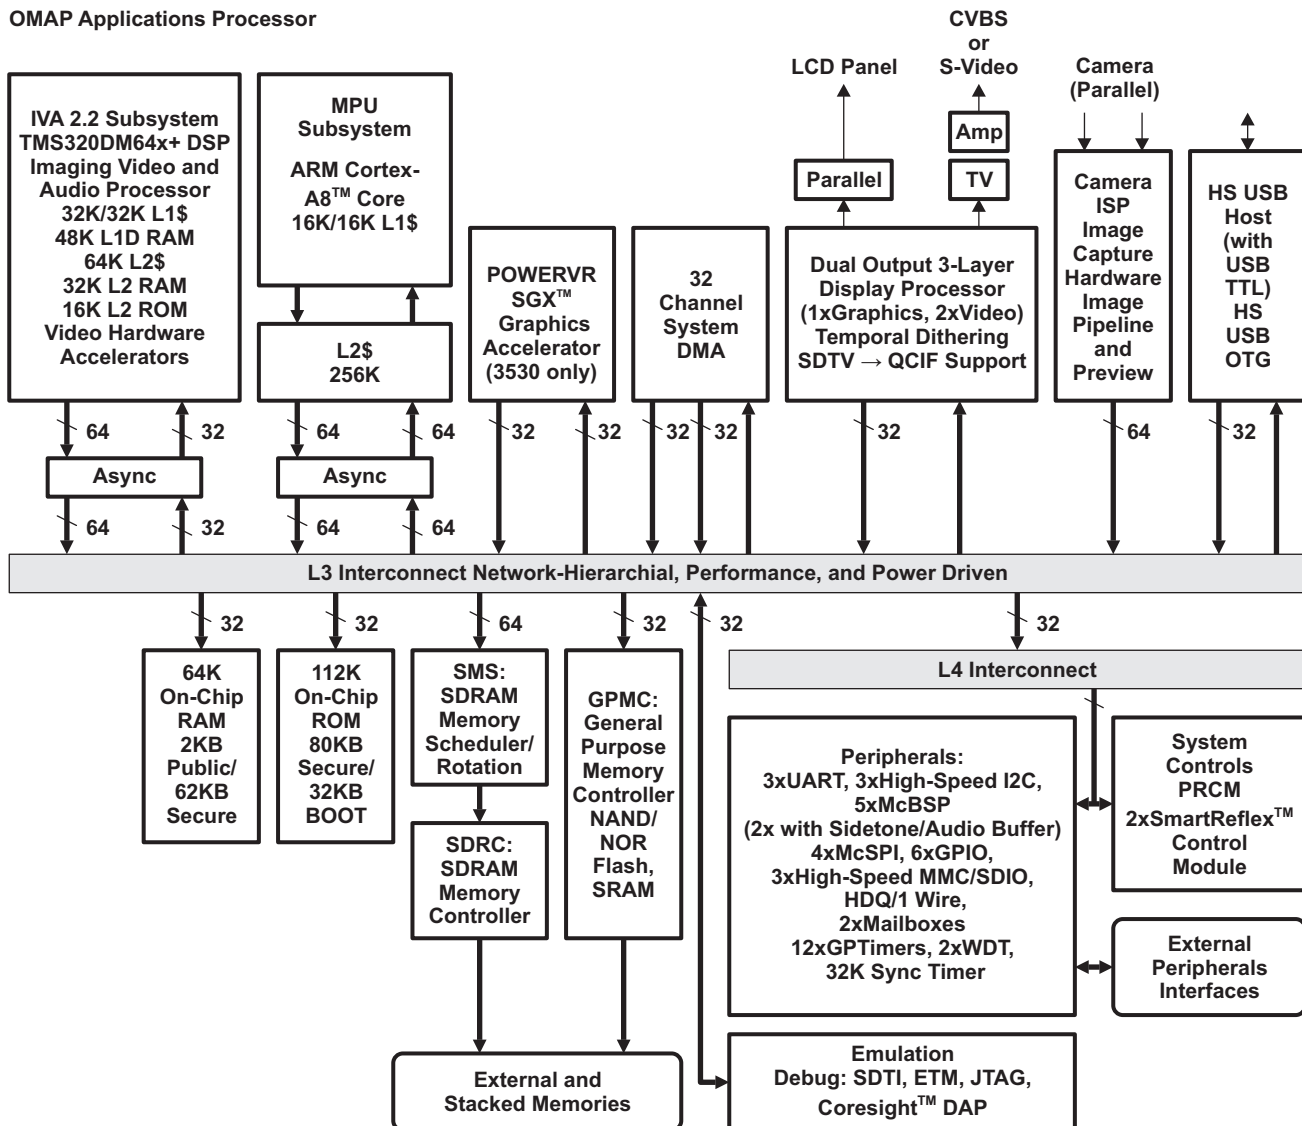

Figure 1-4. 3530/25 Block Diagram

OMAP Applications Processor

NOTE: Some features are not available on all devices. See [Section 1.5, OMAP35x Family](#), for more information on available features.

1.3.1 MPU Subsystem

The MPU subsystem integrates the following modules

- ARM subchip
 - ARM® Cortex™-A8 core
 - ARM Version 7™ ISA: Standard ARM instruction set + Thumb®-2, Jazelle® RCT Java accelerator, and media extensions
 - NEON™ SIMD coprocessor (VFP lite + media streaming instructions)
 - Cache memories
 - Level 1: 16KB instruction and 16KB data—4-way set associative cache, 64 bytes/line
 - Level 2: see [Section 1.5, OMAP35x Family](#).
- Interrupt controller (MPU IN TC) of 96 synchronous interrupt lines

- Asynchronous interface with core logic
- Debug, trace, and emulation features: ICE-Crusher, ETM, ETB modules.

1.3.2 IVA2.2 Subsystem

The device includes a high-performance imaging video and audio (IVA2.2) accelerator based on the Texas Instruments TMS320DMC64x+ VLIW DSP core.

The IVA2.2 subsystem includes the following main features:

- 32-bit fixed-point media processor
- Very long instruction word (VLIW) architecture based on the programmable enhanced version of C64x DSP core
- Eight instructions/cycle, eight execution units
 - Optimized instruction set for video and imaging processing
 - Eight 8 x 8 or 16 x 16 multiply accumulate (MAC) per cycle
 - Eight slave asynchronous die (SAD) per cycle
 - Eight interpolations $(a + b + 1) \gg 1$ per cycle
 - Two (32-bit x 32-bit > 64-bit) multiply operations per cycle
- Low-power processor and megacell
 - Dynamically mixed 32-bit and 16-bit instruction sets
 - Software pipelined loop (SPLOOP) instruction buffer
 - Separate power domain
 - Supported multiple power-down states
- Two-level memory subsystem hierarchy
 - L1P (program)
 - 32KB direct-mapped cache—32-byte cache line, configurable as cache or memory mapped (Possible values are: 0KB cache/32KB memory, 4KB/28KB, 8KB/24KB, 16KB/16KB, or 32KB/0KB)
 - L1D (data)
 - 32KB 2-way set associative cache—4-byte cache line, configurable as cache or memory mapped (Possible values are: 0KB cache/32KB memory, 4KB/28KB, 8KB/24KB, 16KB/16KB, or 32KB/0KB)
 - 48KB memory-mapped SRAM
 - L2 (program and data)
 - 64KB 4-way set associative cache—128-byte cache line, configurable as cache or memory mapped (Possible values are: 0KB cache/64KB memory, 32KB/32KB, or 64KB/0KB)
 - 32KB memory-mapped SRAM
 - 16KB ROM
- Video hardware accelerators
 - Improved motion estimation (iME) dedicated hardware
 - Improved loop filtering (iLF) dedicated hardware
 - Improved variable length coder/decoder (iVLCD) with quantizing capabilities dedicated hardware
 - Video dedicated sequencer
 - Video local interconnect
 - Local level 2 (L2) memory interface/arbitrer
- Private direct memory access (DMA) controller:
 - 128 logical channels
 - 1D/2D addressing
 - Chaining capability
 - Fully pipelined, two 64-bit read ports, two 64-bit write ports
 - Single access 32-byte or 64-byte incrementing bursts
- Level 1 (L1) interrupt controller (INTC)

- Local IVA2.2 digital phase-locked loop (DPLL) supplying the IVA2.2 subsystem clocking
- 32-entry memory management unit (MMU) for seamless integration in high-level OS environment
- IVA2.2 system interfaces
 - 64-bit L3 port shared for external memory accesses
 - Multithreaded link shared by DSP core and DMA accesses
 - Interface with the L3 interconnect that can be synchronous or asynchronous for clock decoupling between IVA2.2 and L3 interconnect
 - Incrementing burst support
 - Critical line first to reduce line fetch latency to the processor
 - Host port interface (HPI) for MMU programming and access to the IVA2.2 internal memories. Can be synchronous or asynchronous
 - System interfaces: clocking, power management
- C-friendly environment (state-of-the-art C compiler for VLIW architecture)
- Texas Instruments low-overhead DSP-BIOS operating system

NOTE: IVA2.2 is not available on all devices. See [Section 1.5, OMAP35x Family](#), for more information on available features.

1.3.3 On-Chip Memory

On-chip memory configuration offers memory resources for program and data storage:

- 112KB ROM
- 64KB single-access static random access memory (SRAM)

1.3.4 External Memory Interfaces

The device includes two external memory interfaces supporting the stacking of a multichip memory package using the generic POP interface:

- General-purpose memory controller (GPMC)
 - NOR flash, NAND flash (with ECC Hamming code calculation), SRAM and Pseudo-SRAM asynchronous and synchronous protocols
 - Flexible asynchronous protocol control for external ASIC or peripheral interfacing
 - 16-bit data, up to 8 chip-selects (CSs)
 - 128M-byte addressable per chip-select, 1G-byte total address space
 - Nonmultiplexed device with limited address (2K bytes)
- SDRAM controller (SDRC)
 - Mobile single data rate (M-SDR) SDRAM and low-power double data rate (LPDDR) SDRAM
 - 16-bit or 32-bit data, two chip-selects, configurations for a maximum of 4 Gbits supported on each chip-select
 - Work in conjunction with the SDRAM memory scheduler (SMS) companion module

1.3.5 DMA Controllers

The device embeds one generic DMA controller, the system DMA (sDMA) controller, used for memory-to-memory, memory-to-peripheral, and peripheral-to-memory transfers:

- One read port, one write port
- 32 prioritizable logical channels
- 96 hardware requests
- 256 x 32-bit FIFO dynamically allocable between active channels

The device also embeds three dedicated DMA controllers: enhanced DMA (EDMA), which is embedded in the IVA2.2 subsystem, display DMA, and USB HS DMA.

1.3.6 POWERVR SGX™ Graphics Accelerator subsystem (GPU)

- 3D graphics and Vector Graphics accelerator (SGX)
- Tile-based architecture
- Universal scalable shader engine (USSE™) multithreaded engine incorporating pixel and vertex shader functionality reducing die area
- Advanced shader feature set in excess of Microsoft VS3.0, PS3.0, and OGL2.0
- Industry standard API support Open GL-ES 1.1 and OpenGL ES2.0, OpenVG 1.1
- Fine-grained task switching, load balancing, and power management
- Programmable high-quality image anti-aliasing
- Advanced geometry DMA driven operation for minimum CPU interaction
- Fully virtualized memory addressing for OS operation in a unified memory architecture
- Implementation of 2D operations (BITBLTs, ROPs, etc)

1.3.7 Multimedia Accelerators

- Programmable video encode and decode support for H.264, H.263, MPEG4 (SP), WMV9, and JPEG

NOTE: Multimedia accelerators are not available on all devices. See [Section 1.5, OMAP35x Family](#), for more information on available features.

- Camera interface
 - Supports most of the raw image sensors available in the market
 - Includes video processing hardware
 - 12-bit parallel interface supported
 - Pixel clock up to 83 MHz

CAUTION

Clock configurations depend on the core voltage and maximum clock frequencies. Values in this document might not apply to production devices. Refer to your device-specific data manual for supported values for production devices.

- Display interface
 - Display controller
 - Color and monochrome displays up to 2048 x 2048 x 24-bpp resolution
 - 256 x 24-bit entries palette in red, green, blue (RGB)
 - 3,375 colors, 15 grayscales
 - Picture-in-picture (overlay), color-space conversion, rotation, color-phase rotation, and resizing support
 - Remote frame buffer interface
 - Liquid-crystal display (LCD) pixel interfaces (MIPI DPI 1.0) and LCD bus interfaces (MIPI DBI 1.0) supported
 - NTSC/PAL video encoder outputs with integrated digital-to-analog converters (DACs) output are supported on CVBS and S-video TV analog output signals
 - Serial display interface implements high-speed differential output buffers to support FlatLink3G™, Mobile CMADS and MIPI DSI 1.0 formats
 - Embedded DMA controller

1.3.8 Comprehensive Power Management

OMAP35x devices include the following power management features:

- Clock and reset generation and distribution

- Wake-up event management
- SmartReflex™ technology
- Dynamic voltage frequency shifting
- Dynamic power shifting
- Static leakage management

1.3.9 Peripherals

The device supports a comprehensive set of peripherals to provide flexible and high-speed interfacing and on-chip programming resources. provides a list and description of the peripherals available on OMAP35x devices.

Table 1-1. OMAP35x Peripherals

Type	Name	Number	Description
Serial Communication	Multi-channel Buffered Serial Ports (McBSPs)	5	The McBSPs provide a full-duplex direct serial interface between the device and other devices in a system such as audio and voice codecs and other application chips. McBSP1, McBSP2, and McBSP3 serve as general purpose serial ports while McBSP2 and McBSP3 include additional audio-loopback capability.
	Multi-channel Serial Port Interface (McSPI)	4	The McSPIs provide a master/slave interface to SPI devices.
	High-speed Multi-port USB Host Controller	1	High-speed USB2.0 host controller with three host ports each offering high-speed data transactions (up to 480 Mbps) or full-speed/low-speed data transactions (12 and 1.5 Mbps, respectively). In high-speed mode, the USB host controller ports interface to external USB PHYs using a 12-pin or 8-pin UTMI low pin interface (ULPI). In full-speed and low-speed mode, the ports interface to external USB PHYs using a 6-/4-/3-pin serial interface. Additionally each port can be directly connected to a USB device (bypassing the need for USB PHY) by using an the on-chip transceiver-less link logic (TLL) adapter.
	High-speed USB OTG Controller	1	High-speed USB2.0 OTG controller that offers high-speed data transactions (up to 480 Mbps) on a USB port with embedded DMA controller. The high-speed USB OTG controller interfaces to an external USB PHY using a 12-pin UTMI low pin interface (ULPI).
	HDQ/1-Wire®	1	The HDQ/1-Wire interface supports the Benchmark HDQ protocol and the Dallas Semiconductor 1-Wire protocol.
	Universal Asynchronous Receiver/Transmitter (UART)	3	Serial communication interfaces compatible to the industry standard TL16C550 asynchronous communications element. UART1 and UART 2 are general serial communication interfaces. UART3 provides additional support for infrared data association (IrDA) and consumer infrared (CIR) communications.
	High-speed (HS) Inter-integrated Circuit (I2C) Controllers	3 ⁽¹⁾	Master/slave I2C high-speed standard interfaces with support for standard mode (up to 100K bits/s), fast mode (up to 400K bits/s), and high-speed mode (up to 3.4M bits/s).
Removable Media	Multimedia Card/Secure Digital/Secure Digital I/O (MMC/SDIO) Card Interface	1	MMC memory card, SD memory card, or SDIO cards interface.

⁽¹⁾ A fourth master/transmitter high-speed I2C interface (I2C4) is included in the power, reset, and clock management (PRCM) module to perform dynamic voltage control and power sequencing.

Table 1-1. OMAP35x Peripherals (continued)

Type	Name	Number	Description
Miscellaneous	GP timers	12	Twelve general-purpose timers
	Watchdog timers (WDTs)	2	Three watchdog timers
	32-kHz synchronization timer	1	32-kHz clock timer
	General-purpose input/output (GPIO)	Package-specific	General-purpose input/output pins controlled by six GPIO controllers.
	Mailbox	6	MPU/IVA2.2 inter-processor communications mailboxes. All six mailboxes are available in chassis mode, however, only two mailboxes are available in stand-alone mode.
	Control module	1	I/O multiplexing and chip-configuration control.
Security Modules (High-security Devices Only)			RNG, Fast PKA, 2xDES/3DES, SHA1/MD5, SHA2/MD5, 2xAES, Secure Watchdog Timer, and universal subscriber identity module (USIM).

1.4 Package-On-Package Concept

The OMAP35x CBB package provides a package-on-package (POP) memory interface to support multiple stacked package configurations, including a flash multi-chip package, depending on customer needs. Note that use of standalone memory devices is also possible on the CBB package; use of POP technology is not required.

The stacked memory package is directly connected to the two memory interfaces (GPMC and SDRC) of the OMAP35x CBB package through the POP interface present at the top. For more information on the interconnect between the stacked memory package and the OMAP35x CBB package, see Chapter 11, Memory Subsystem, and your device-specific OMAP35x data manual.

NOTE: Before using the POP memory interface, a compatible memory device supply must first be secured directly from specific memory vendors.

Figure 1-5 shows the concept of the POP solution, and Figure 1-6 shows stacked memory package on the POP device.

Figure 1-5. POP Concept (CBB Package)

108-003

Figure 1-6. Stacked Memory Package on the POP Device (CBB Package)

108-004

The memory interfaces should be correctly configured based on the memory package used with the POP device.

Table 1-2 summarizes the supported configurations with the generic POP interface.

NOTE: Use of standalone memory devices is also possible on the CBB package; use of POP technology is not required.

Table 1-2. Summary of Memories Supported by the POP Interface

Generic POP Interface Features Set	SDRC Interface	GPMC Interface
Type of memory supported	MDDR	NOR flash asynchronous and synchronous burst flash NAND flash "CE don't care" One NAND on CS0 and CS1 NOR flash address/data nonmultiplexed is not supported.
Number of chip-selects	2	2
Maximum density per chip-select	4G bits	1G bit NOR flash
Maximum size per interface	8G bits	2G bits NOR flash
Interface width	X 32 bits	X 16 bits
I/O voltage	1.8 V LVCMOS	1.8 V LVCMOS

For more information on the memory interface configuration, see the *Memory Subsystem* chapter.

The POP device includes feedthroughs in addition to the GPMC and SDRC interfaces positioned at the top of the package. Up to 47 feedthroughs are defined from the bottom ball-grid array (BGA) to the top (or POP) interface to support different memory combinations.

The feedthroughs either provide power to a top memory device or provide specific memory signals (for example, control and/or address signals) from the bottom BGA to the POP interface.

NOTE: It is possible to monitor the DDR SDRAM temperature if the memory multichip package allows the temperature sensing option. A feedthrough is used to lower the temperature sensing dedicated signal to make a connection with a GPIO. For more information on DDR SDRAM temperature sensing management, see the *Memory Subsystem* and the *General-Purpose Interface* chapters.

Figure 1-7 shows the implementation of feedthroughs on the POP and the different paths between the bottom and the top of the package.

Figure 1-7. Stacked Memory Package on the POP Device (CBB Package)

108-005

- (1) Path 1: feedthrough only; Path 2: all but feedthrough; Path 3: POP interface (SDRC + subset GPMC)
- (2) Any signal available on the POP interface to a top-side ball is also available to a bottom-side ball.

1.5 OMAP35x Family

1.5.1 Device Features

The OMAP 3 architecture is configured with different sets of features in different devices. This technical reference manual details all of the features available in current and future OMAP35x devices. Some features may not be available or supported in your particular device. The features supported across different OMAP35x devices are shown on [Table 1-3](#) (CBB, CBC and CUS packages) . For more information on the CBB, CBC, and CUS packages, refer to your device-specific data manual.

1.5.2 Device Identification

The identification registers include the CONTROL_IDCODE and CONTROL_DIE_ID data registers. These registers are accessible through the L4 interconnect port starting at physical address 0x4830 A204 and 0x4830 A218, respectively. See the Memory Mapping chapter for more information about the L4 memory space mapping. [Table 1-5](#) describes the identification registers.

The silicon type can be read in the HAWKEYE bit field value of the CONTROL.CONTROL_IDCODE register. The silicon revision can be read in the VERSION bit field value of the CONTROL.CONTROL_IDCODE register.

Table 1-5. Device Identification Registers

Register Name	Address	Size
CONTROL.CONTROL_IDCODE[31:0]	0x4830 A204	32
CONTROL.CONTROL_DIE_ID[127:0]	0x4830 A218	128

To retrieve OMAP35x chip identification, see [Table 1-6](#). This register helps software identify chip derivative.

1.5.2.1 720MHz Device Identification

Read device ID to be able to identify if this device is 720MHz capable or not. There is SKU ID that is blown in efuse and that it readable from following the memory location.

Register 0x4830A20C [ProdID.SKUID] [0:3]:

- 0x0 for normal 600/430MHz device.
- 0x8 for 720/520MHz device.

1.5.2.1.1 Procedure for Calculation of SmartReflex nValue for OPP6

Read OPP5 nTargetvalue from Efuse register.

```
opp5nValue = Read32(0x48002390);
```

- Extract SenPGain, SenNGain, SenPRN, SenNRN values

```
SenPGain_fuse = (opp5nValue & 0x00F00000) >> 0x14
```

```
SenNGain_fuse = (opp5nValue & 0x000F0000) >> 0x10
```

```
SenPRN_fuse = (opp5nValue & 0x0000FF00) >> 0x08
```

```
SenNRN_fuse = (opp5nValue & 0x000000FF)
```

Use following Delta NNT & PNT target values for following calculation:

```
DELTA NNT = +379
```

```
DELTA PNT = +227
```

Calculate Adjusted SenPGain, SenNGain, SenPRN, SenNRN as shown below:

```
function [Radj, Gainadj] = CaluclateRG(RFuse, gainFuse, DeltaNT)
{
    Nadj=2^(GainFuse+8)/RFuse+DeltaNT
    for (G=0: G < 16; G++)
    {
        R=(1/Nadj)*2^(G+8);
        if (R < 256) then
        {
            Radj=R;
            Gainadj=G;
        }
    }
}
[SenNRN, SenNGain]=CalculateRG(SenNRN_fuse, SenNgain_fuse, DeltaNNT]
[SenPRN, SenPGain]=calculateRG(SenPRN_fuse, SenPGain_fuse, DeltaPNT]
```

Formulate OPP6 values using following formula:

```
Opp6nValue = (SenPGain << 0x14) | (SenNGain << 0x10) | (SenPRN << 0x08) | (SenNRN)
```

1.5.3 General Recommendations Relative to Unavailable Features/Modules

As explained in the previous section, some features are not available in all OMAP35x devices. For unavailable features, use the following recommendations:

- Memory mapping: Memory area of unavailable modules and features are RESERVED, read is undefined, and write can lead to unpredictable behavior.
- Interrupt controllers: Ensure that interrupts of unavailable modules and features are masked in MPU/IVA subsystems.
- DMA: Ensure that DMA requests of unavailable modules and features are masked in DMA subsystems.
- System Control Module (SCM): Unavailable modules and feature pins are not functional and should not be used.
- Power, Reset, and Clock Management Module (PRCM): For power management and power-saving consideration, ensure that power domains of unavailable features/modules are switched off and clocks are cut off.
- Interconnect: To flag potential interconnect outstanding commands, the time-out of target agents attached to unavailable modules can be enabled with the lowest setting.

Memory Mapping

This chapter describes memory mapping.

NOTE: This chapter gives information about all modules and features in the high-tier device. To check availability of modules and features, see [Section 1.5, OMAP35xx Family](#). In unavailable modules and features, the memory area is reserved, read is undefined, and write can lead to unpredictable behavior.

Topic	Page
2.1 Introduction	196
2.2 Global Memory Space Mapping	198
2.3 L3 and L4 Memory Space Mapping	201
2.4 IVA2.2 Subsystem Memory Space Mapping	210

2.1 Introduction

The microprocessor unit (MPU) has a 32-bit address port, allowing it to handle a 4-GB space divided into several regions, depending on the target type.

The memory map is composed of a memory space (general-purpose memory controller [GPMC], synchronous dynamic random access memory [SDRAM] controller [SDRC], etc.), register space (L3 and L4 interconnects), and dedicated spaces (image and video accelerator [IVA2.2] subsystem, SGX, etc.), all of which are shared among the initiators (for example, the microprocessor [MPU] subsystem or the IVA2.2 subsystem).

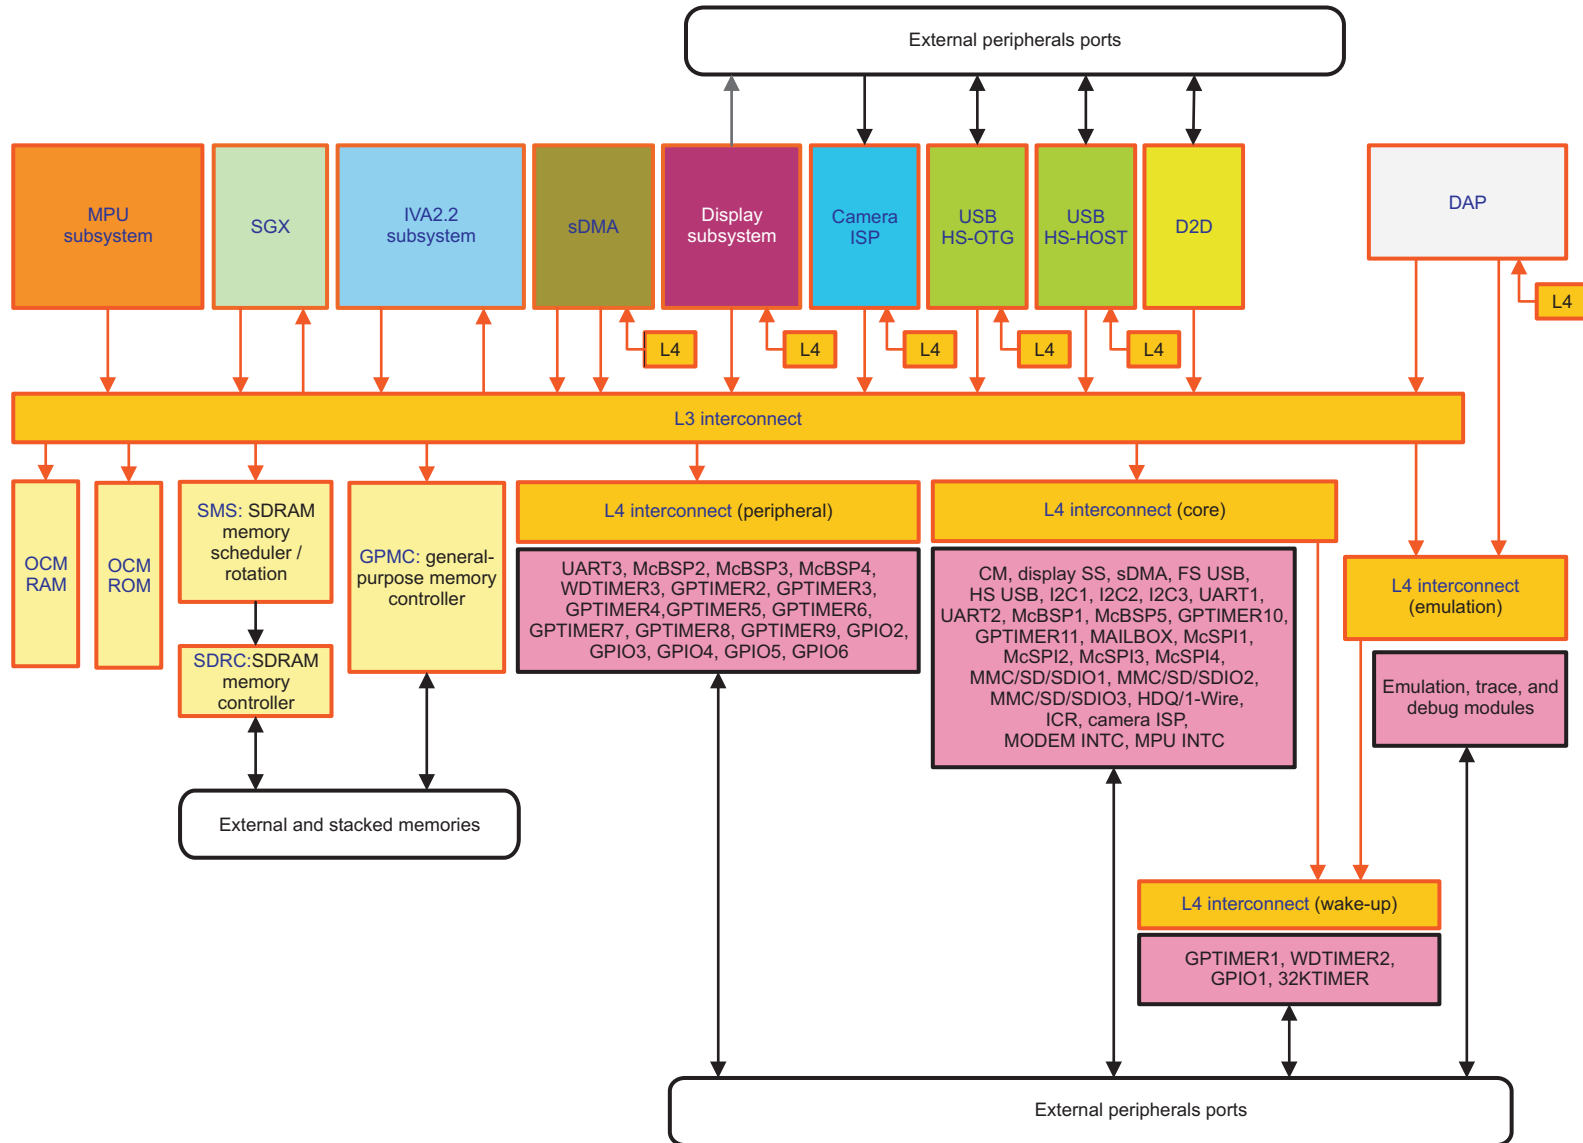

The GPMC and SDRC are dedicated to memory connection. The GPMC is used for NOR/NAND flash and SRAM memories. The SDRC is used for SDRAM memories, such as regular SDR-SDRAM (single data rate), regular JEDEC DDR1 memory (double data rate), low-power SDR-SDRAM, and mobile DDR-SDRAM. For more information, see [Chapter 11, Memory Subsystem](#).

The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, among all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers between initiators and targets across the platform are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. For more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device, see [Chapter 5, Interconnect](#).

[Figure 2-1](#) shows the interconnect of the device and the main modules and subsystems in the platform.

Figure 2-1. Interconnect Overview

memmap-114-001

2.2 Global Memory Space Mapping

This section provides a global view of the memory mapping and describes the boot, GPMC, SDRC, and virtual rotated frame buffer (VRFB) memory spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- Level 1: Four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1GB address space (total address space is 4GB).
- Level 2: Each quarter is divided into eight blocks of 128MB, with target spaces mapped in the blocks.

This organization allows all target spaces to be decoded based on the five most-significant bits (MSBs) of the 32-bit address ([31:27]).

- **Boot space**

The system has a 1MB boot space in the on-chip boot ROM or on the GPMC memory space.

When booting from the on-chip ROM with the appropriate external `sys_boot5` pin configuration, the 1MB memory space is redirected to the on-chip boot ROM memory address space [0x4000 0000 – 0x400F FFFF].

When booting from the GPMC with the appropriate external `sys_boot5` pin configuration, the memory space is part of the GPMC memory space.

For more information about `sys_boot5` pin configuration, see [Chapter 11, Memory Subsystem](#), and [Chapter 25, Initialization](#).

- **GPMC space**

Eight independent GPMC chip-selects (`gpmc_ncs0` to `gpmc_ncs7`) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM memories. The chip-selects have a programmable start address and programmable size (16MB, 32MB, 64MB, or 128MB) in a total memory space of 1GB.

- **SDRC space**

Two SDRC chip-selects (`sdrc_ncs0` and `sdrc_ncs1`) are available on the third quarter (Q2) of the addressing space to access SDRAM memories. The chip-selects have a programmable size (64, 128, 256 or 512MB) in a total memory space of 1GB.

The base address of the chip-select 0 (`sdrc_ncs0`) memory space is always 0x8000 0000. The base address of the chip-select 1 (`sdrc_ncs1`) memory space is programmable. The default value after reset is 0xA000 0000.

- **VRFB space**

The SDRC-SMS virtual memory space is a different memory space used to access a subset of the SDRC memory space through the rotation engine. The virtual address space size is 768MB split into two parts: The first 256MB part is in the second quarter (Q1) of the memory; the second 512MB part is in the fourth quarter (Q3) of the memory.

For more information about boot, GPMC, SDRC, and VRFB, see [Chapter 11, Memory Subsystem](#).

This section describes all modules and features in the high-tier device. To check availability of modules and features, see [Section 1.5, OMAP35xx Family](#). In unavailable modules and features, the memory area is reserved, read is undefined, and write can lead to unpredictable behavior.

[Table 2-1](#) describes the global memory space mapping.

Table 2-1. Global Memory Space Mapping

(1) Boot space location depends on the external sys_boot5 pin configuration.

(2) Executable

(3) Peripherals connected to the L4-Wakeup interconnect are accessed through the L4-Core interconnect.

Table 2-1. Global Memory Space Mapping (continued)

QUARTER	Device Name	Start Address (HEX)	End Address (HEX)	Size	Description
	SDRC/SMS virtual Address space #0	0x7000 0000	0x7FFF FFFF	256MB	SDRC-SMS virtual address space 0
Q2 (1GB)	SDRC/SMS			1GB	SDRAM main address space (SMS)
	CS0 – SDRAM ⁽⁴⁾	0x8000 0000	0x9FFF FFFF	512MB	SDRC/SMS
	CS1 – SDRAM ⁽⁴⁾	0xA000 0000	0xBFFF FFFF	512MB	SDRC/SMS
Q3 (1GB)	Reserved			512MB	Reserved
	Reserved	0xC000 0000	0xDFFF FFFF	512MB	Reserved for future use
	SDRC/SMS			512MB	SDRC/SMS
	SDRC/SMS virtual Address space 1	0xE000 0000	0xFFFF FFFF	512MB	SDRC-SMS virtual address space 1

⁽⁴⁾ Chip-select 0 and chip-select 1 spaces are configurable in the 1GB SDRC/SMS space.

2.3 L3 and L4 Memory Space Mapping

The memory space system is hierarchical: L1, L2, L3, and L4.

L1 and L2 are memories in in the MPU and the IVA2.2 subsystems.

The chip-level interconnect, which consists of one L3 and four L4s, enables communication among all modules and subsystems.

L3 handles many types of data transfers, including data exchange with system on-chip/external memories.

The four L4s handle transfers with peripherals, but are in four distinct power domains: the L4-Core, L4-Wakeup, L4-Per, and L4-Emu interconnects, which are in the CORE, WKUP, PER, and EMU power domains, respectively.

For more information about the interconnect, see [Chapter 5, Interconnect](#).

The following sections describe the register mapping of the L3 and L4 interconnects. The software configures these registers.

2.3.1 L3 Memory Space Mapping

The L3 interconnect control registers are mapped in a 16MB space and allow the configuration of the L3 interconnect parameters.

The L3 default settings are fully functional and enable all possible functional data paths. However, the interconnect parameters can be changed to accommodate expectations.

Accesses to the L3 interconnect can be configured on a per-module basis using the internal L3 registers, which are grouped into five register block types:

- IA: Initiator agent configuration registers
- TA: Target agent configuration registers
- RT: Register target (global configuration registers)
- PM: Protection mechanism (firewalls) configuration registers
- SI: Global sideband signal configuration registers

For more information, see [Chapter 5, Interconnect](#).

This section describes all modules and features in the high-tier device. To check availability of modules and features, see [Section 1.5, OMAP35xx Family](#). In unavailable modules and features, the memory area is reserved, read is undefined, and write can lead to unpredictable behavior.

[Table 2-2](#) describes the mapping of the L3 interconnect control registers.

Table 2-2. L3 Control Register Mapping

Device Name	Start Address (Hex)	End Address (Hex)	Size (KB)	Description

2.3.2 L4 Memory Space Mapping

The device contains four L4 interconnects: L4-Core, L4-Wakeup, L4-Per, and L4-Emu.

As with the L3 interconnect, the L4 interconnects can be configured to tune the access depending on the characteristics of each module.

For more information about the L4 interconnect, see [Chapter 5, Interconnect](#).

2.3.2.1 L4-Core Memory Space Mapping

The L4-Core interconnect is a 16MB space composed of the L4-Core interconnect configuration registers and the module registers.

[Table 2-3](#) describes the mapping of the registers for the L4-Core interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4-Core interconnect. All other accesses are internal to the L4-Core interconnect.

This section describes all modules and features in the high-tier device. To check availability of modules and features, see [Section 1.5, OMAP35xx Family](#). In unavailable modules and features, the memory area is reserved, read is undefined, and write can lead to unpredictable behavior.

2.3.2.4 L4-Emulation Memory Space Mapping

The L4-Emu interconnect is an 8MB space composed of the L4-Emu interconnect configuration registers and module registers.

Table 2-6 describes the mapping of the registers for the L4-Emu interconnect.

NOTE: All memory spaces described as modules provide direct access to the module registers outside the L4-Emu interconnect. All other accesses are internal to the L4-Emu interconnect.

Table 2-6. L4-Emulation Memory Space Mapping

Device Name	Start Address (Hex)	End Address (Hex)	Size	Description

2.4 IVA2.2 Subsystem Memory Space Mapping

This section describes the hardware accelerators of IVA2.2. To check availability of these modules, see [Section 1.5, OMAP35xx Family](#). In unavailable modules and features, the memory area is reserved, read is undefined, and write can lead to unpredictable behavior.

The device includes the high-performance Texas Instruments IVA2.2. For more information, see [Chapter 14, IVA2.2 Subsystem](#).

This section describes how the IVA2.2 internal memories and registers are accessed through the L3 interconnect and by the IVA2.2 internal initiators (the digital signal processor [DSP] and the enhanced direct memory access [EDMA]).

Three views of the IVA2.2 subsystem memory space mapping are provided:

- L3 interconnect view: External view (subsystem memories and configuration registers) as seen by the MPU subsystem and most of the initiators of the platform through the L3 interconnect
- IVA2.2 DSP view: Internal view as seen by the DSP
- IVA2.2 EDMA view: Internal view as seen by the EDMA

NOTE: The IVA2.2 subsystem also contains a local interconnect with its own memory space mapping that can be accessed only by the DSP and the video accelerator and sequencer in the IVA2.2 subsystem. For more information about this video accelerator/sequencer local interconnect and its memory space mapping, see [Chapter 14, IVA2.2 Subsystem](#).

2.4.1 IVA2.2 Subsystem Internal Memory and Cache Allocation

2.4.1.1 IVA2.2 Subsystem Memory Hierarchy

The IVA2.2 subsystem includes the following memory features:

- L1P (program)
 - 32KB configurable: Memory-mapped (default after reset) or direct-mapped cache—32-byte cache line
- L1D (data)
 - 32KB configurable: Memory-mapped (default after reset) or 2-way set associative cache—64-byte cache line
 - 48KB memory-mapped
- L2 (program and data)
 - 64KB configurable: Memory-mapped (default after reset) or 2-way set associative cache—128-byte cache line
 - 32KB memory-mapped
 - 16KB ROM

The local memories can be used as cache RAMs or memory-mapped RAMs, depending on the configuration of the different memory controllers in the IVA2.2 subsystem.

[Figure 2-2](#) shows the memory hierarchy of the IVA2.2 subsystem.

Figure 2-2. IVA2.2 Subsystem Memory Hierarchy

mmap-002

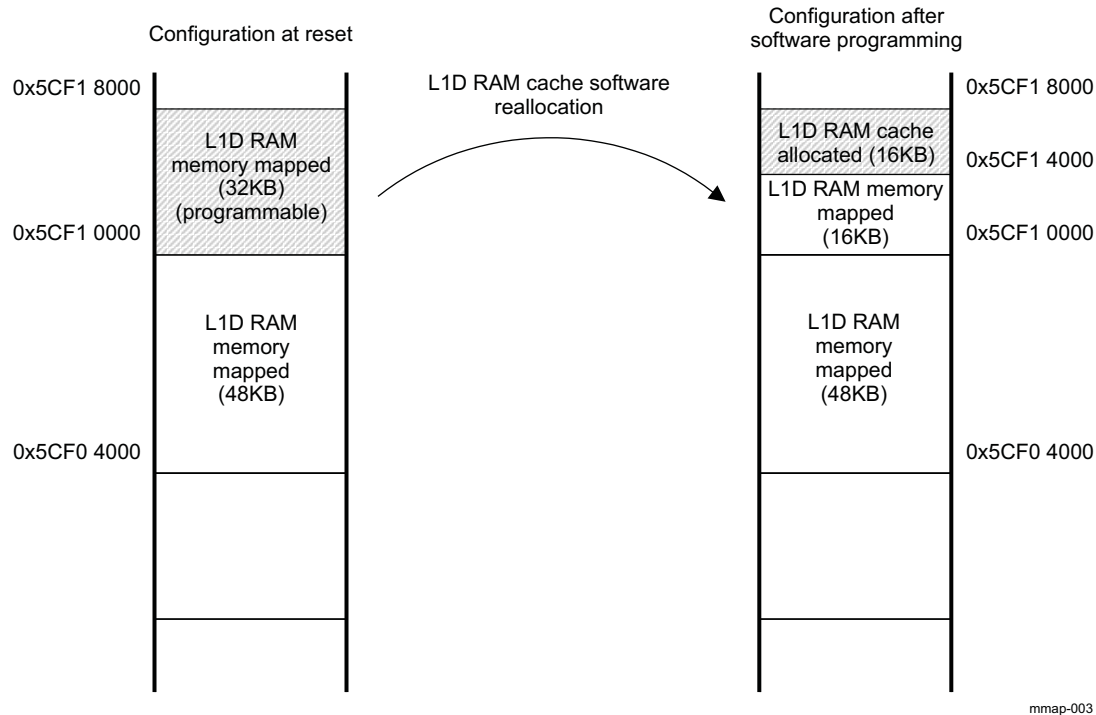

2.4.1.2 IVA2.2 Cache Allocation

After reset, the L1P RAM is used as a 32KB memory-mapped RAM. The L1P RAM can be programmed in the C64x+ DSP program memory controller to allocate 0 (default), 4, 8, 16, or 32KB to cache. When 32KB are allocated to cache, there is no more memory-mapped L1P.

After reset, the L1D RAM is used as an 80KB memory-mapped RAM. The L1D RAM can be programmed in the C64x+ DSP data memory controller to allocate 0 (default), 4, 8, 16, or 32KB to cache. When 32KB are allocated to cache, 48KB are still allocated to the memory-mapped L1D.

After reset, the L2 is used as a 96KB memory-mapped RAM. The L2 can be programmed to allocate 0 (default), 32, or 64KB to cache. When 64KB are allocated to cache, 32KB are still allocated to memory-mapped L2.

Figure 2-3 is an example of the L1D RAM cache allocation, where 16KB are allocated to cache.

Figure 2-3. L1D RAM Cache Allocation Example (L3 Interconnect View)

2.4.2 DSP Access to L2 Memories

2.4.2.1 DSP Access to L2 ROM

The IVA2.2 subsystem contains 16KB of L2 ROM. The L2 ROM provides boot code.

When the L1P cache is configured to be inactive (default configuration), DSP program fetch accesses to the L2 ROM are accomplished directly, and thus suffer the L2 latency.

When the L1P cache is configured to be active, DSP program fetch accesses to L2 ROM are always serviced by the L1P cache controller, which partly hides the L2 latency.

2.4.2.2 DSP Access to L2 RAM

The IVA2.2 contains 96KB of L2 RAM. The L2 RAM can be configured to allocate up to 64KB to the L2 cache.

When the L1P and L1D caches are configured to be inactive (default configuration), DSP accesses to the L2 RAM are accomplished directly and thus suffer the L2 latency.

When the L1P and L1D RAM are configured to be active, DSP program accesses to L2 RAM are always serviced by the L1P cache controller (if code fetch) or the L1D cache controller (if data access), which partly hides the L2 latency.

2.4.3 DSP and EDMA Access to Memories and Peripherals

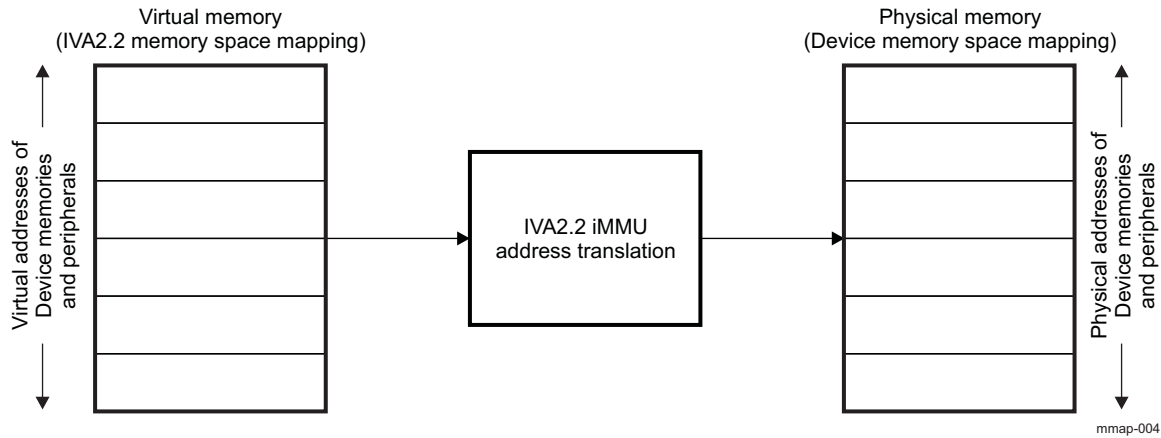

The IVA2.2 DSP and EDMA access the memories and peripherals using virtual addressing. This lets the DSP and EDMA access memories and peripherals in the same contiguous view, even when the memory is physically segmented. [Table 2-9](#) and [Table 2-10](#) give the address range where the DSP and the EDMA can access the memories and peripherals, respectively.

The IVA2.2 memory management unit (IVA2.2 iMMU) handles the virtual-to-physical address translation based on the software configuration (typically under control of the MPU subsystem).

Virtual addresses are issued by the initiator to the IVA2.2 iMMU. Using the translation look-aside buffer (TLB), the MMU translates the initiator virtual addresses into real physical addresses.

Figure 2-4 shows the relationship among physical addresses, virtual addresses, and the IVA2.2 iMMU.

Figure 2-4. IVA2.2 iMMU Address Translation

For more information about the MMU, see [Chapter 8, Memory Management Units](#).

2.4.4 L3 Interconnect View of the IVA2.2 Subsystem Memory Space

Table 2-8 lists the IVA2.2 subsystem memory space mapping from the perspective of the MPU subsystem through the L3 interconnect.

Table 2-8. L3 Interconnect View of the IVA2.2 Subsystem Memory Space

MPU Subsystem

This chapter describes the microprocessor unit (MPU) subsystem.

NOTE: Some features may not be available or supported in your particular device. For more information, see Chapter 1, the Device Family section, and your device-specific data manual.

Topic	Page
3.1 MPU Subsystem Overview	218
3.2 MPU Subsystem Integration	220
3.3 MPU Subsystem Functional Description	228
3.4 MPU Subsystem Basic Programming Model	234

3.1 MPU Subsystem Overview

3.1.1 Introduction

The MPU subsystem of the device handles transactions among the ARM core, the L3 interconnect, and the interrupt controller (INTC).

The MPU subsystem is a hard macro that integrates the ARM subchip with additional logic for protocol conversion, emulation, interrupt handling, and debug enhancements. Figure 3-1 is a high-level block diagram of the MPU subsystem.

Figure 3-1. MPU Subsystem Overview

3.1.2 Features

The MPU subsystem integrates the following:

- ARM subchip
 - Public ARM Cortex™-A8 core
 - ARM version 7 ISA: Standard ARM instruction set + Thumb-2™, Jazelle® RCT Java accelerator, and media extensions
 - Neon single instruction, multiple data (SIMD) coprocessor (VFP light + media streaming instructions)
 - Cache memories
 - Level 1: 16-KB instruction and 16-KB data caches – 4-way associative, 64 bytes/line
 - Level 2: See [Section 1.5](#), *OMAP35xx Family*.
 - Emulation/debug
- INTC of 96 synchronous level-sensitive interrupt lines (For details, see [Chapter 10](#), *Interrupt Controller*.)
- AXI2OCP bridge between ARM AXI bus, L3 master open-core protocol (OCP) bus, and INTC master OCP bus
- MPU clock generator: Clock generation module that generate clocks, power modes, and idle and active acknowledge signals
- Debug, trace, and emulation features: ICECrusher™, embedded trace macrocell (ETM), advanced peripheral bus (APB) modules. Cortex-A8 MPU implements an APB slave interface that allows access to ETM, ICECrusher, and debug registers.

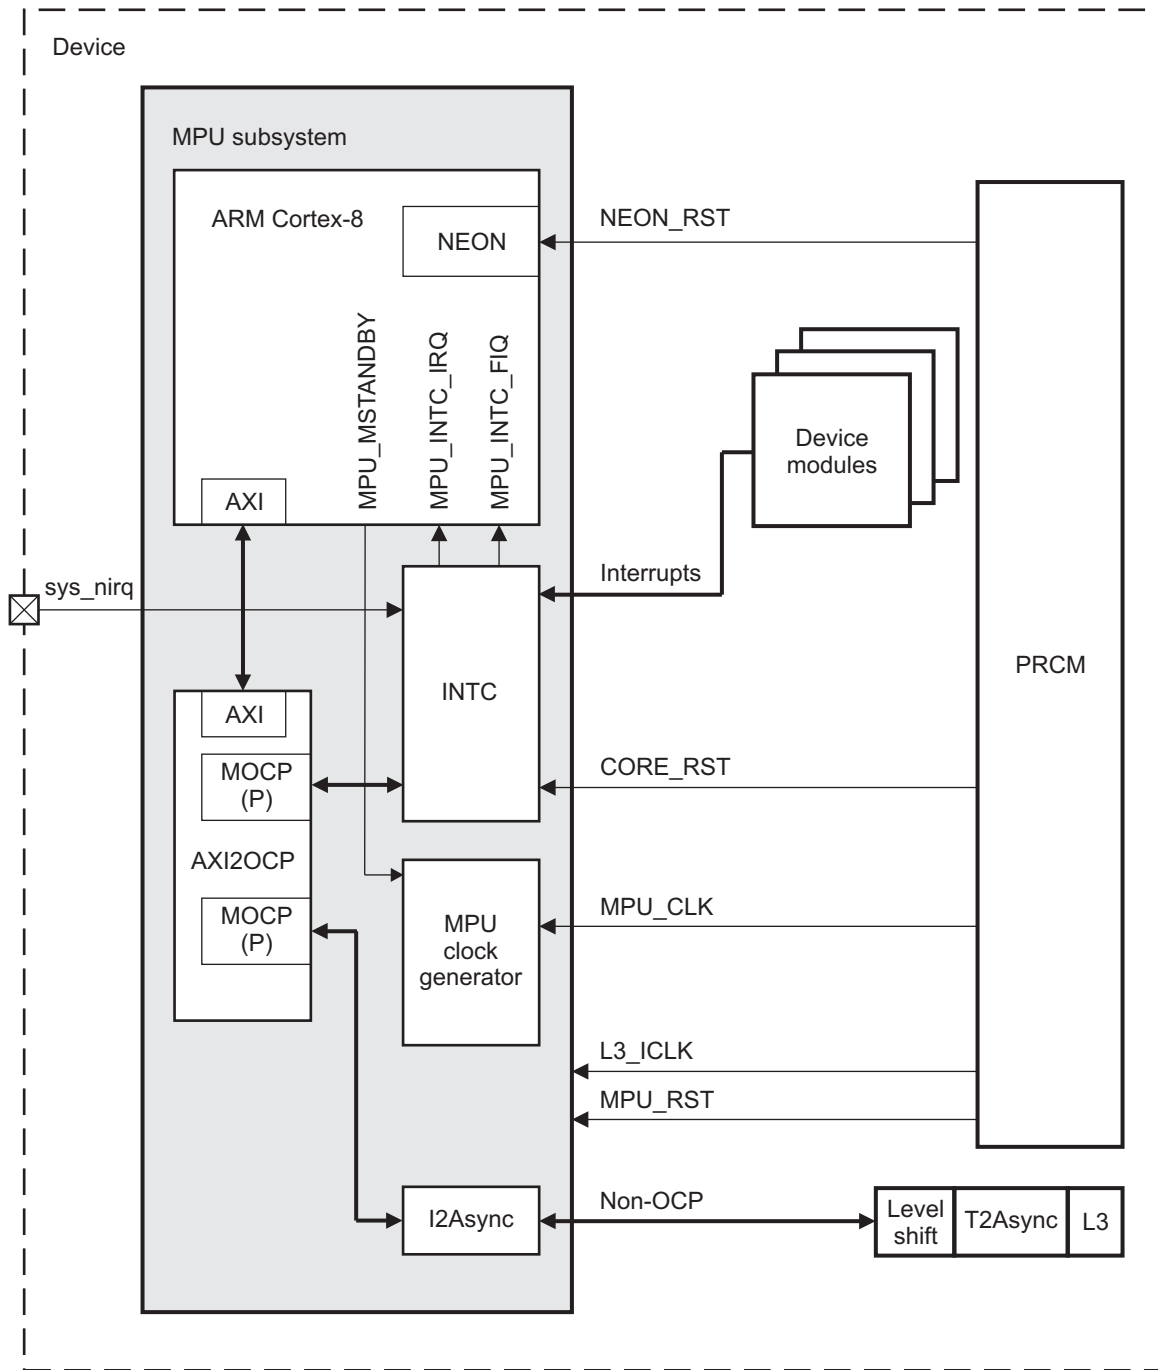

3.2 MPU Subsystem Integration

The MPU subsystem integrates the following group of submodules:

- Public ARM Cortex-A8 MPU: Provides a high processing capability, including the Neon technology for mobile multimedia acceleration. The ARM communicates through an AXI bus with the AXI2OCP bridge and receives interrupts from the MPU INTC.
- INTC: Handles module interrupts (for details, see [Chapter 10, Interrupt Controller](#)).
- AXI2OCP bridge: Allows communication among the ARM (AXI), the INTC (OCP), and the modules (OCP L3).
- I2Async bridge: An asynchronous bridge interface providing an asynchronous OCP-to-OCP interface. This interface is between the AXI2OCP bridge in the MPU subsystem and the T2Async bridge external to the MPU subsystem. The T2Async bridge connects to OCP L3.
- MPU clock generator: Provides clocks to internal modules of the MPU subsystem; fed by the MPU digital phase-locked loop (DPLL) of the power, reset, and clock management (PRCM) module of the device. The MPU DPLL generates the clock for the ARM Cortex-A8 CPU and the Cortex-A8 MPU subsystem logic. The power, reset, and MPU DPLL source clock are generated from the device PRCM module.

[Figure 3-2](#) shows the signals that interface with the external modules.

Figure 3-2. MPU Subsystem Integration Overview

mpuss-002

NOTE: Some debug, trace, and emulation features are implemented in the MPU subsystem. This chapter includes only clock/reset inputs and power-management aspects for these features.

3.2.1 MPU Subsystem Clock and Reset Distribution

3.2.1.1 Clock Distribution

The MPU subsystem includes a clock generator block that supplies clocks for the modules in the MPU subsystem. It is fed by the MPU_CLK clock from the PRCM module.

All major modules in the MPU subsystem are clocked at half the frequency of the ARM core. The divider of the output clock can be programmed with the PRCM.CM_CLKSEL2_PLL_MPU[4:0] MPU_DPLL_CLKOUT_DIV bit field; the frequency is relative to the ARM core. For details see [Chapter 4, Power, Reset, and Clock Management \(PRCM\) module](#). The clock generator generates the following functional clocks:

- **ARM (ARM_FCLK):** This is the core clock. It is the base fast clock that is routed internally to the ARM logic and internal RAMs, including Neon, L2 cache, the ETM core (emulation), and the ARM core. It runs at one half the frequency of the MPU_CLK when DPLL1 is locked, and runs at the same frequency as the MPU_CLK when DPLL1 is bypassed.
- **AXI2OCP clock (AXI_FCLK):** This clock is half the frequency of the ARM clock (ARM_FCLK). The OCP interface thus performs at one half the frequency of ARM.
- **INTC functional clock (MPU_INTC_FCLK):** This clock, which is part of the INTC module, is half the frequency of the ARM clock (ARM_FCLK).
- **ICE-Crusher functional clock (ICECRUSHER_FCLK):** ICECrusher clocking operates on the APB interface, using the ARM core clocking.
- **I2Async clock (I2ASYNC_FCLK):** This clock is half the frequency of the ARM clock (ARM_FCLK). It matches the OCP interface of the AXI2OCP bridge.

NOTE: The second half of the asynchronous bridge (T2ASYNC) is clocked directly by the PRCM module with the core clock. T2ASYNC is not part of the MPU subsystem.

Emulation clocking: Except for the ICECrusher functional clock, which is provided by the MPU DLL, the emulation modules in the MPU subsystem are not generated by the MPU subsystem DPLL, but by an EMU DPLL. These clocks (EMU_CLOCKS) are distributed by the PRCM module, are asynchronous with the ARM core clock (ARM_FCLK) and can run at a maximum of 1/3 the ARM core clock.

Figure 3-3 shows the MPU subsystem clocking scheme.

Figure 3-3. MPU Subsystem Clocking Scheme

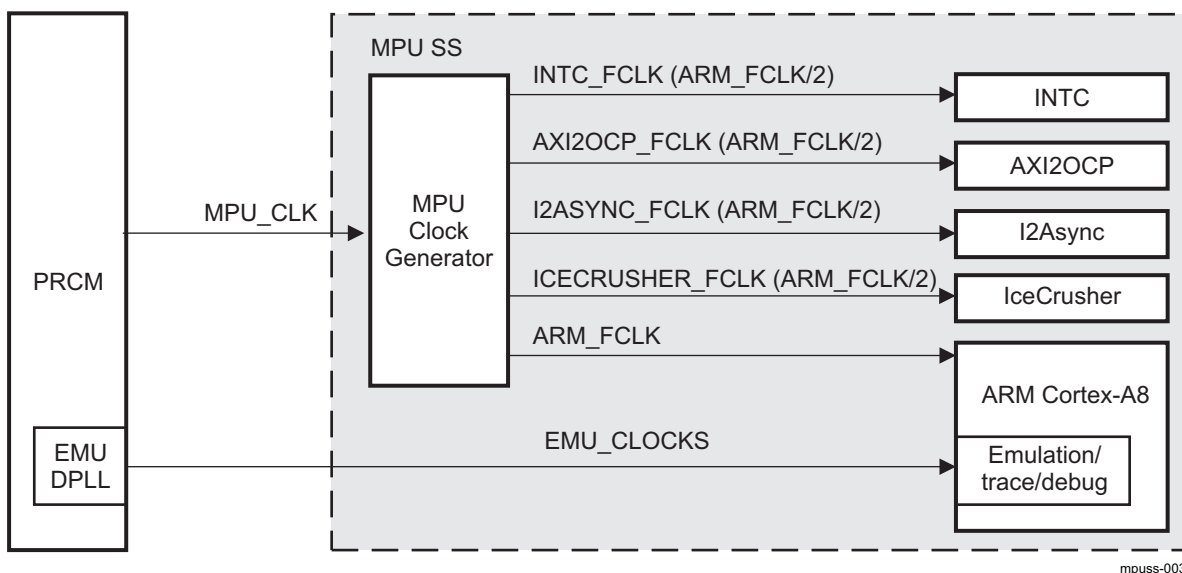

Table 3-1 lists the clocks generated in the MPU subsystem by the MPU clock generator.

Table 3-1. MPU Clock Generator Clock Signals

Signal Name	I/O	Interface	Comments
MPU_CLK	I	PRCM	MPU DPLL clock out
ARM_FCLK	O	ARM	ARM functional clock
MPU_INTC_FCLK	O	MPU INTC	MPU INTC functional clock
I2ASYNC_FCLK	O	I2Async	I2Async functional clock
AXI_FCLK	O	AXI2OCP	AXI2OCP functional clock
ICECRUSHER_FCLK	O	ICE-Crusher	ICECrusher functional clock

3.2.1.2 Reset Distribution

Resets to the MPU subsystem are provided by the PRCM module and controlled by the clock generator module. There are as many reset signals as power domains. For details about power domains, see [Section 3.3.2.1](#). [Figure 3-4](#) shows the reset scheme of the MPU subsystem.

Figure 3-4. MPU Subsystem Reset Scheme

Table 3-2. MPU Subsystem Reset Signals

Signal Name	I/O	Interface	Comments
MPU_RST	I	PRCM	MPU power domain reset
Neon_RST	I	PRCM	Neon power domain reset
CORE_RST	I	PRCM	CORE power domain reset
MPU_RSTPWRON	I	PRCM	ICECrusher reset. It is active only on cold reset.
EMU_RST	I	PRCM	Emulation interconnect reset
EMU_RSTPWRON	I	PRCM	Emulation modules reset

For details about clocks, resets, and power domains, see [Chapter 4, Power, Reset, and Clock Management](#).

3.2.2 ARM Subchip

3.2.2.1 ARM Overview

The public ARM Cortex-A8 processor incorporates the technologies available in the ARM7 architecture. These technologies include Neon for media and signal processing and Jazelle RCT for acceleration of realtime compilers, Thumb-2 technology for code density and the VFPv3 floating-point architecture.

For details, see the public ARM Cortex-A8 Technical Reference Manual.

3.2.2.2 ARM Description

3.2.2.2.1 Public ARM Cortex-A8 Instruction, Data, and Private Peripheral Port

The AXI bus interface is the main interface to the ARM system bus. It performs L2 cache fills and noncacheable accesses for instructions and data. The AXI interface supports 64-bit wide input and output data buses. It supports multiple outstanding requests on the AXI bus and a wide range of bus clock-to-core clock ratios. The bus clock is synchronous with the core clock.

See the public ARM Cortex-A8 Technical Reference Manual for a complete programming model of the transaction rules (ordering, posting, and pipeline synchronization) that are applied depending on the memory region attribute associated with the transaction destination address.

3.2.2.2.2 MPU Subsystem Features

[Table 3-3](#) is a list of main functionalities of the ARM core supported in the MPU subsystem for the device. The MPU subsystem implements the ARM7™ instruction set architecture.

Table 3-3. ARM Core Key Features

Feature	Comment
ARM version 7 ISA	Standard ARM instruction set + Thumb-2, Jazelle RCT Java accelerator, and media extensions. Backward-compatible with previous ARM ISA versions.
L1 Icache and Dcache	16KB, 4-way, 64-byte cache line, and 128-bit interface. Note: L1 memories cannot be put in retention mode.
L2 Cache	The L2 cache and cache controller are embedded in the ARM core. For size, see Section 1.5, OMAP35xx Family .
TLB	Fully associative and separate ITLB with 32 entries and DTLB with 32 entries
CoreSight ETM	The CoreSight ETM is embedded in the ARM core. The 4KB buffer (ETB) exists at the device level.
Branch target address cache	512 entries
Enhanced Memory Management Unit	Mapping sizes are 4KB, 64KB, 1MB, and 16MB. ARM MMU adds extended physical address ranges.
Neon	Enhances throughput for media workloads and VFP-Lite support
Tightly coupled memory	Not present
AXI Bus	Separate 64-bit input and 64-bit output data buses. The public ARM Cortex-A8 has a single AXI bus interface. The AXI interface is shared by instruction fetches, data accesses, peripheral accesses and PLE (on-chip preload engine, previously known as DMA) accesses. DMA is available.
Low interrupt latency	Interrupt request (IRQ) and fast interrupt request (FIQ) are directly connected to ARM and INTC is before L3.
Vectored Interrupt Controller Port	Not used
JTAG based debug	Supported through debug access port (DAP)
Trace support	Supported through trace port interface unit (TPIU)
External coprocessor	Not supported

For more information, see the public *ARM Cortex-A8 Technical Reference Manual*.

3.2.2.3 Clock, Reset, and Power Management

3.2.2.3.1 Clocks

Table 3-4 shows the ARM functional clock. For configuration, see [Chapter 4, Power, Reset, and Clock Management](#).

Table 3-4. MPU Subsystem Clock Signal

Signal Name	I/O	Interface	Comments
ARM_FCLK	I	MPU Clock Generator	Functional clock

3.2.2.3.2 Reset

Table 3-5 lists the resets for the ARM. They include the power domain reset, Neon_RST, which resets the Neon module of the ARM subchip only, and MPU_RST, which resets the rest of the ARM subchip and the AXI2OCP and I2Async bridges.

Table 3-5. ARM Reset Signals

Signal Name	I/O	Interface	Comments
MPU_RST	I	PRCM	MPU power domain reset
Neon_RST	I	PRCM	Reset Neon only
EMU_RST	I	PRCM	Emulation interconnect reset
EMU_RSTPWON	I	PRCM	Emulation modules reset

3.2.2.3.3 Power Management

For details, see [Section 3.3.2](#).

3.2.3 AXI2OCP and I2Async Bridges

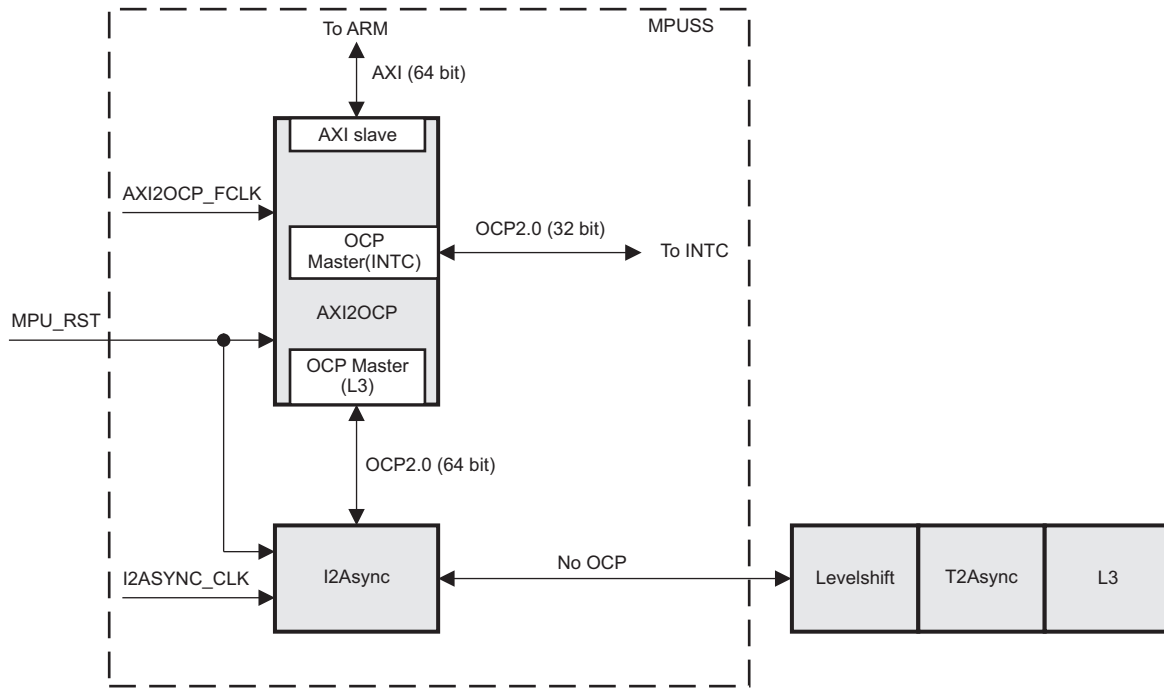

3.2.3.1 Bridges Overview

The AXI2OCP bridge connects the AXI bus on the ARM MPU to the OCP native L3 interconnect and INTC. It converts between AXI and OCP protocols and maintains a mapping of AXI tags to the OCP thread ID. This bridge is responsible for some minimal address decoding to determine where to forward requests between L3 and INTC.

Bridging to the L3 is accomplished through an asynchronous interface involving the I2Async and T2Async modules. The I2Async module in the MPU subsystem has an OCP port that is asynchronously transferred to the T2Async module and routed to the L3. T2Async is outside the MPU subsystem.

NOTE: The interface between I2Async and T2Async is not an OCP protocol.

[Figure 3-5](#) is an overview of the AXI2OCP and the L3 bridges.

Figure 3-5. Bridges Overview

mpuss-006

3.2.3.2 AXI2OCP Description

The AXI2OCP bridge key features are:

- Connection to the L3 interconnect through a 64-bit OCP port. Address bus is 32-bit.
- Connection to the INTIC through a 32-bit OCP port (only single transactions are supported)
- Support of single-request-multiple-data (data handshaking) burst mode to pipeline requests to L3. Bursts with width less than 64 bits are converted as single requests on L3. This can affect system performance. The INTIC does not support burst transfers
- Support of multiple outstanding requests
- Remapping of the AXI tags to five OCP threads:
 - Instruction fetch (Thread_IR)
 - Cacheable data read (Thread_CR)
 - Cacheable data write (Thread_CW)
 - Noncacheable data read (Thread_DR)
 - Noncacheable data write (Thread_DW)
- Interface to the L3 through the asynchronous bridge (I2Async)
- Emulation and support of boot-mode translation
- Translation of exclusive accesses to nonexclusive read/write in the bridge
- Boot mode address translation
- Force write nonposted support
- Debug related: Ready fail, force ready
- Interconnect attach neutralizer
- Narrow burst support
- Time-out counter for nonresponsive slaves on OCP

3.2.3.3 Clocks, Reset, and Power Management

3.2.3.3.1 Clocks

Table 3-6 lists the bridge functional clocks.

Table 3-6. Bridge Clock Signals

Signal Name	I/O	Interface	Comments
AXI2OCP_FCLK	I	MPU Clock Generator	AXI2OCP functional clock
I2ASYNC_FCLK	I	MPU Clock Generator	I2Async functional clock

3.2.3.3.2 Reset

Table 3-7 lists the bridge reset. It is a power domain reset that also resets the ARM.

Table 3-7. MPU Subsystem Reset Signal

Signal Name	I/O	Interface	Comments
MPU_RST	I	PRCM	MPU power domain reset

3.2.3.3.3 Power Management

For details, see [Section 3.3.2](#).

3.2.4 Interrupt Controller

For information, see [Chapter 10, Interrupt Controllers](#).

3.2.4.1 Clocks

Table 3-8 lists the INTC clocks.

Table 3-8. Bridge Clock Signals

Signal Name	I/O	Interface	Comments
MPU_INTC_FCLK	I	MPU Clock Generator	INTC functional clock
MPU_INTC_ICLK	I	OCP Clock	INTC interface clock

3.2.4.2 Reset

Table 3-9 lists the reset of the INTC. It is a power domain reset that resets the entire CORE power domain. For details, see [Chapter 10, Interrupt Controller](#) and [Chapter 4, Power, Reset, and Clock Management](#).

Table 3-9. MPU Subsystem Reset Signal

Signal Name	I/O	Interface	Comments
CORE_RST	I	PRCM	CORE power domain reset

3.2.4.3 Power Management

See [Chapter 10, Interrupt Controller](#), and [Chapter 4, Power, Reset, and Clock Management](#).

3.3 MPU Subsystem Functional Description

3.3.1 Interrupts

The MPU INTC is connected to the MPU through the AXI2OCP bridge. It runs at half-processor speed. The INTC prioritizes all service requests from the system peripherals and generates an IRQ or an FIQ to the MPU, depending on the INTC programming. The INTC handles only interrupts directed to the MPU subsystem. A maximum of 96 requests can be steered/prioritized as MPU FIQ or IRQ interrupt requests. For details, see [Chapter 10, Interrupt Controller](#).

3.3.2 Power Management

3.3.2.1 Power Domains

The MPU subsystem is divided into five power domains controlled by the PRCM module, as shown in [Figure 3-6](#). The EMU and CORE power domains are not fully embedded in the MPU subsystem.

Figure 3-6. MPU Subsystem Power Domain Overview

Power-management requirements at the device level govern power domains for the MPU subsystem.

The device-level power domains are directly aligned with voltage domains and thus can be represented as a cross reference to the different voltage domains. [Table 3-10](#) shows the power domains of the MPU subsystem and the modules inside it.

Table 3-10. Overview of the MPU Subsystem Power Domain

Functional Power Domain	Physical Power Domain per System/Module
MPU subsystem domain	ARM, AXI2OCP, I2Asynch Bridge, ARM L1 and L2 periphery logic and array, ICECrusher, ETM, APB modules

Table 3-10. Overview of the MPU Subsystem Power Domain (continued)

Functional Power Domain	Physical Power Domain per System/Module
MPU Neon domain	ARM Neon accelerator
CORE domain	MPU INTC
EMU domain	EMU (ETB, DAP)

NOTE: L1 and L2 array memories have separate control signals to the MPU subsystem; thus are directly controlled by the PRCM module.

For information about the physical power domains and the voltage domains, see [Chapter 4, Power, Reset, and Clock Management](#).

3.3.2.2 Power States

Each power domain can be driven by the PRCM module in four power states, depending on the functional mode required by the user.

Table 3-11. MPU Power States

Power State	Logic Power	Memory Power	Clocks	Memory State Retention
ACTIVE	On	On or Off	On (at least one clock)	All
INACTIVE	On	On or Off	Off	All
RETENTION	On or Off	On or Off	Off (all clocks)	All or part
OFF	Off	Off	Off (all clocks)	None

For each power domain, the PRCM module manages all transitions by controlling domain clocks, domain resets, domain logic power switches, memory power switches, and memory retention. The MPU DPLL internally synchronizes the internal clocks, resets, and switches.

3.3.2.3 Power Modes

MPU DPLL power modes:

The PRCM.CM_AUTOIDLE_PLL_MPU[2:0] AUTO_MPU_DPLL bit field lets the MPU DPLL be put in an auto-idle mode when set to 0x1. In this mode, the MPU DPLL is automatically put in low power stop mode when the MPU clock is not required. It is also restarted automatically. [Table 3-12](#) describes the power modes of the MPU DPLL in auto-idle or manual mode. The manual modes (locked and low-power bypass) can be configured by the PRCM.CM_CLKEN_PLL_MPU[2:0] EN_MPU_DPLL bit field. The status of the MPU DPLL clock activity can be checked with the PRCM.CM_IDLEST_PLL_MPU[0] ST_MPU_CLK bit.

Table 3-12. MPU DPLL Power Modes

Mode	System Input Clock	Clock Output	DPLL Power State	Condition
Locked	ON	ON	ON	Software request (manual) or MPU wakes up (auto)
Low-power bypass	ON	ON	ON	Software request (manual) or on global reset release (auto)
Stop low power	OFF	OFF	ON	MPU is RET or OFF (auto).
OFF	OFF	OFF	OFF	Device is OFF (auto).

The MPU DPLL power domain is switched off automatically by the PRCM module only when the device enters OFF mode.

MPU subsystem power modes:

The major part of the MPU subsystem belongs to the MPU power domain. Modules in this power domain can be off when the ARM processor is in OFF or standby mode. IDLE/WAKEUP control is managed by the clock generator block, but initiated by the PRCM module. The MPU standby status can be checked with the PRCM.CM_IDLEST_MPU[0] ST_MPU bit.

For the MPU to be on, the core (referred to here as the device core) power must be on.

Device power management does not allow INTC to go to OFF state when the MPU domain is on (active or one of the retention modes).

The Neon core is in independent power off mode when not in use. Enabling and disabling of Neon can be controlled by software.

The MPU retention modes are described in [Table 3-13](#).

Table 3-13. MPU Retention Modes

Name	ARM Logic	L1	L2
Dormant	OFF	OFF	RET
RET	RET	RET	RET

[Table 3-14](#) lists the supported operational power modes. All other combinations are illegal. The ARM L2, Neon, and ETM/debug can be powered up/down independently. The APB/ATB ETM/Debug column refers to all three features: ARM emulation, trace, and debug.

Table 3-14. MPU Subsystem Operation Power Modes

Mode	MPU and ARM Core Logic	ARM L2 RAM	Neon	OMAP Core INTC	APB/ATB ETM/Debug	Comments
1	Active	Active	Active	Active	Disabled or enabled	Functional active run mode (ETM enabled mode when emulation/debug required. Production devices should have ETM disabled).
2	Active	Active	OFF	Active	Disabled or enabled	Functional active run mode. Neon disabled through software; Neon is internally clock-gated.
3	Active	RET	Active	Active	Disabled or enabled	Do not use; see ⁽¹⁾ .
4	Active	RET	OFF	Active	Disabled or enabled	Do not use; see ⁽¹⁾ .
5	Active	OFF	Active	Active	Disabled or enabled	Active mode; L2 is off. Controlled through software to the PRCM module. L2 context save and restore required or L2 flush.
6	Active	OFF	OFF	Active	Disabled or enabled	Active mode; L2 is off. Controlled through software to the PRCM module. L2 context save and restore required or L2 flush.

⁽¹⁾ The L2 can be put in retention mode regardless of other voltage domain states. The combination of Cortex Logic active and L2 in retention mode (modes 3 and 4) is legal, but results in incorrect execution of instructions with referencing data from L2. This combination must not be used.

Table 3-14. MPU Subsystem Operation Power Modes (continued)

Mode	MPU and ARM Core Logic	ARM L2 RAM	Neon	OMAP Core INTC	APB/ATB ETM/Debug	Comments
7	OFF	RET	OFF	OFF	Disabled or enabled	Lowest power sleep mode (dormant mode); L2 is in retention. Controlled through software to the PRCM module. ARM core and L1 context save and restore required or L1 flush.
8	Standby	Active	Standby	Active	Disabled or enabled	Standby mode. StandbyWFI (wait for interrupt) controlled to put into standby and wakeup through interrupt.
9	Standby	Active	OFF	Active	Disabled or enabled	Standby mode. StandbyWFI controlled to put into standby and wakeup through interrupt when Neon is off.
10	Standby	RET	Standby	Active	Disabled or enabled	Standby mode (retention mode). StandbyWFI controlled to put into standby and wakeup through interrupt when L2 is in retention.
11	Standby	RET	OFF	Active	Disabled or enabled	Standby mode (retention mode). StandbyWFI controlled to put into standby and wakeup through interrupt when L2 is in retention and Neon is off.
12	Standby	OFF	Standby	Active	Disabled or enabled	Standby mode. StandbyWFI controlled to put into standby and wakeup through interrupt when L2 is off.
13	Standby	OFF	OFF	Active	Disabled or enabled	Standby mode. StandbyWFI controlled to put into standby and wakeup through interrupt when L2 and Neon are off.
14	OFF	OFF	OFF	OFF	Disabled or enabled	Power-down mode

In any mode where the MPU or Neon power domains are active, the MPU DPLL clocks must be active (modes 1, 3, and 5 require active clocks from the DPLL, while modes 7 and 8 do not).

Thus, the MPU DPLL must be in one of the following states:

- Locked
- Low-power bypass: inclk = on, clkout = on, power = on

When the MPU DPLL is not providing clocks, the MPU subsystem must be in a power mode where the MPU power domain, Neon power domain, debug power domain, and INTC power domain are in standby, RETENTION, or OFF state. The states of the MPU DPLL can be:

- Locked
- STOP low power
- OFF

CAUTION

The L2 can be put into retention mode regardless of other voltage domain states. The combination of ARM Logic active and L2 in retention mode (modes 3 and 4) is legal, but results in incorrect execution of instructions with referencing data from L2. This combination must not be used.

3.3.2.4 Transitions

[Table 3-15](#) describes allowable transitions from power modes described in [Table 3-14](#). For example, a transition from mode 13 to mode 4 is allowed, but the reverse is not true, because the L2 RET to OFF is illegal.

Any mode change that requires state saving or flush must be serialized. For example, L2 RET does not require state saving, so it can happen at the same time as power-down Neon. L2 off and Neon off cannot happen at the same time, because L2 flush and Neon state saving must be serialized. Standby mode can enter from active mode only by executing the WFI instruction.

Table 3-15. Power Mode Allowable Transitions

From	To Power Mode													
	1	2	3	4	5	6	7	8	9	10	11	12	13	14
1	Y	Y	Y	Y	Y			Y						Y
2	Y	Y	Y	Y		Y			Y		Y			Y
3	Y	Y	Y	Y			Y			Y				
4	Y	Y	Y	Y			Y				Y			
5	Y		Y	Y	Y	Y	Y			Y		Y		Y
6		Y	Y	Y	Y	Y	Y				Y		Y	Y
7	Y	Y	Y	Y			Y							
8	Y		Y					Y		Y				
9	Y	Y	Y	Y					Y		Y			
10	Y		Y					Y		Y				
11	Y	Y	Y	Y					Y		Y			
12	Y		Y		Y							Y		
13	Y	Y	Y	Y	Y	Y			Y		Y		Y	
14	Y	Y	Y	Y	Y	Y	Y							Y

For more information about clocks, reset, power management, and wake-up events for the MPU subsystem, see [Chapter 4, Power, Reset, and Clock Management](#).

3.4 MPU Subsystem Basic Programming Model

For detailed descriptions of registers used for MPU configuration, see [Chapter 4, Power, Reset, and Clock Management](#), and [Chapter 10, Interrupt Controller](#).

3.4.1 Clock Control

For clock configuration settings, see [Chapter 4, Power, Reset, and Clock Management](#).

3.4.2 MPU Power Mode Transitions

The following subsections describe transitions of different power modes for the MPU power domain:

- Basic power on reset
- MPU to standby mode
- MPU out of standby mode
- MPU power on from a powered-off state

3.4.2.1 Basic Power-On Reset

The following power-on reset (POR) sequence applies to initial power-up and wakeup from device off mode:

1. Reset DPLL, supply reference clock, program the MPU DPLL in applicable DPLL mode to generate clocks for MPU subsystem modules. This is controlled solely by the PRCM module.
2. Reset the INTC (CORE_RST) and the MPU subsystem modules (MPU_RST). The clocks must be active during MPU reset and CORE reset.

3.4.2.2 MPU to Standby Mode

The following MPU to standby mode sequence applies to initial power-up and wakeup from device off mode:

1. The ARM core initiates entering standby through software only (CP15 - WFI).
2. MPU modules requested internally by MPU subsystem to enter idle, after ARM core standby detected.
3. MPU is in standby output asserted for the PRCM module (all outputs ensured to be at reset values).
4. The PRCM module requests the INTC to enter idle mode. Acknowledge from INTC goes to the PRCM module.
5. The PRCM module starts to shut down clocks through DPLL programming.

NOTE: The INTC SWAKEUP output is a pure hardware signal to the PRCM module for the status of its IDLE request and IDLE acknowledge handshake.

NOTE: In debug mode, ICECrusher can prevent the MPU subsystem from entering IDLE mode.

3.4.2.3 MPU Out of Standby Mode

The following MPU out of standby mode sequence of operation applies to initial power-up and wakeup from device off mode:

1. PRCM must start clocks through DPLL programming.
2. Detect active clocking through status output of DPLL.
3. Initiate an interrupt through the INTC to wake up the ARM core from STANDBYWFI mode.

3.4.2.4 MPU Power-On from a Powered-Off State

1. To minimize the peaking of current during power up, DPLL power on, MPU power on, Neon power on, and Core power on (INTC) should follow the ordered sequence per power switch daisy chain.

NOTE: Before the MPU can be reset, the CORE power domain must be on, and reset, with the DPLL clocks on.

2. Follow the reset sequence as described in [Section 3.4.2.1](#), *Basic Power-On Reset*.

3.4.3 Neon Power Mode Transition

Because of the hardware sleep dependency between Neon and the MPU domain, when the Neon power domain transition is configured to automatic hardware-supervised mode (the CM_CLKSTCTRL_Neon[1:0] CLKTRCTRL_Neon bit field is set to 0x3), it cannot transition to idle mode unless the MPU goes to standby mode. The MPU domain must also be configured in automatic hardware-supervised mode (the CM_CLKSTCTRL_MPU[1:0] CLKTRCTRL_MPU bit field must be set to 0x3) for the Neon power domain transition to occur.

3.4.4 ARM Programming Model

For the complete programming model, see the public *ARM Cortex-A8 Technical Reference Manual*.

Power, Reset and Clock Management

This chapter describes power, reset, and clock management.

4.1 Introduction to Power Management

This introduction contains the following information:

- Requirement and goal of power management in mobile devices
- State-of-the-art power-management techniques for maximizing battery life for mobile devices
- Essential architectural building blocks for power management
- Overview of the device power-management architecture

4.1.1 Goal of Power Management

Power management (efficient use of the available limited battery resources of a mobile device) is one of the most important design aspects of any mobile system. It imposes strong control over limited available power resources to ensure that they function for the longest possible time.

The device architecture ensures maximum performance for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

4.1.2 Power-Management Techniques

The following sections describe the state-of-the-art power-management techniques supported by the device.

NOTE: The values in [Figure 4-1](#) through [Figure 4-3](#), which show power-management techniques, are hypothetical only. They do not represent valid test results on the device.

4.1.2.1 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) reduces the device voltage and frequency by minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to let a task be performed in the required amount of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

[Figure 4-1](#) compares energy consumption with and without DVFS.

Figure 4-1. Comparison of Energy Consumption With/Without DVFS

prcm-001

Figure 4-1 shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode. With DVFS (right side of the figure), the operating frequency is reduced to an optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, voltage can be further reduced to save power so dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their optimal operating points, it is possible to minimize the power consumption of the device for a given task.

For practical reasons related to device making (flow, tools), DVFS can be used for only a few discrete steps, not over a continuum of voltage and frequency values. Each step, or operating performance point (OPP), is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally, the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

4.1.2.2 Dynamic Power Switching

Like DVFS, dynamic power switching (DPS) is a power-management technique that reduces active power consumption of a device. However, whereas DVFS reduces dynamic and leakage power consumption, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

With DPS, the system switches dynamically between high- and low-consumption system power modes during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch to a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

Figure 4-2 compares energy consumption with and without DPS.

Figure 4-2. Comparison of Energy Consumed With/Without DPS

prcm-003

Figure 4-2 compares the power consumption behavior for the same device operation without DPS (left side of the figure) and with DPS (right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to zero. However, the transitions between system power modes can require storing the information before entering a low-power inactive state and restoring the information after a wake-up event (see Figure 4-2). This results in additional dynamic power consumption, referred to as the transition overhead, (see Figure 4-2). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to dynamically predict the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, however, the user can identify an optimal idle-time limit after which the DPS is useful for dynamic power-saving.

4.1.2.3 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches to low-power system modes automatically or in response to user requests during system standby (in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

4.1.2.4 DPS Versus SLM

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10 μ s and 100 μ s) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are more related to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1 ms to 10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

4.1.2.5 Combining Power-Management Techniques

The DVFS, DPS and SLM, power-management techniques have different features and are most effective when used under specific device operating conditions. Hence, the best active power saving is obtained by combining the techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

When application performance requirements fall between two OPPs, or when required application performance is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS, the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

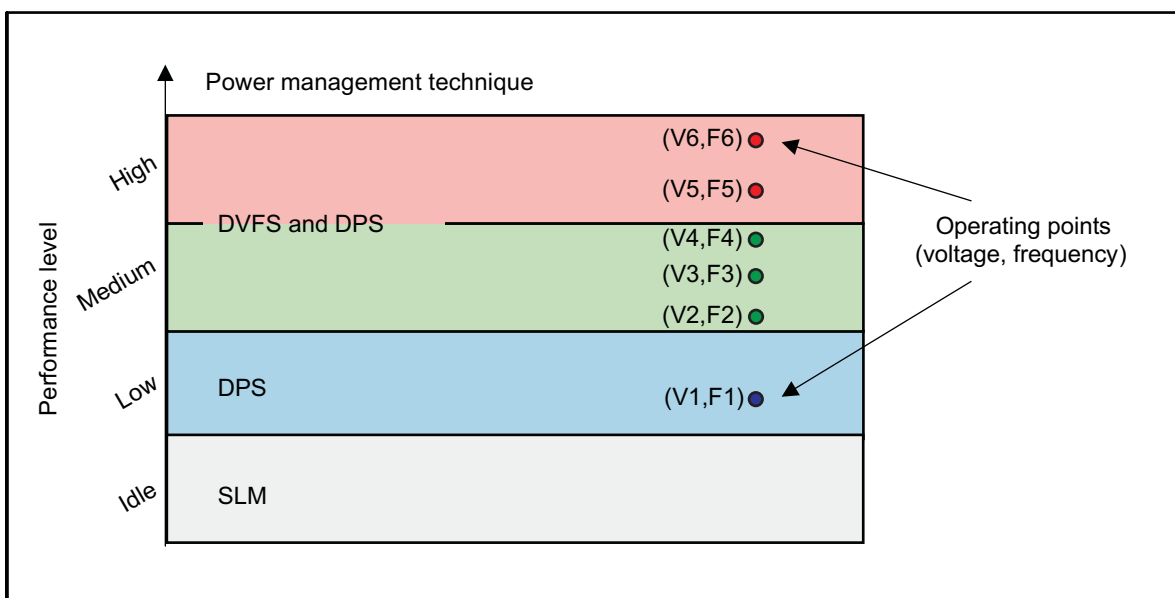

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy. It does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation and battery life.

In situations where no applications are running and performance requirement drops to zero, SLM must be used.

Figure 4-3 compares combinations of the power-management techniques.

NOTE: The OPPs shown in Figure 4-3 are for explanation only. They do not correspond to validated OPPs of the device.

Figure 4-3. Performance Level and Applied Power-Management Techniques

prcm-004

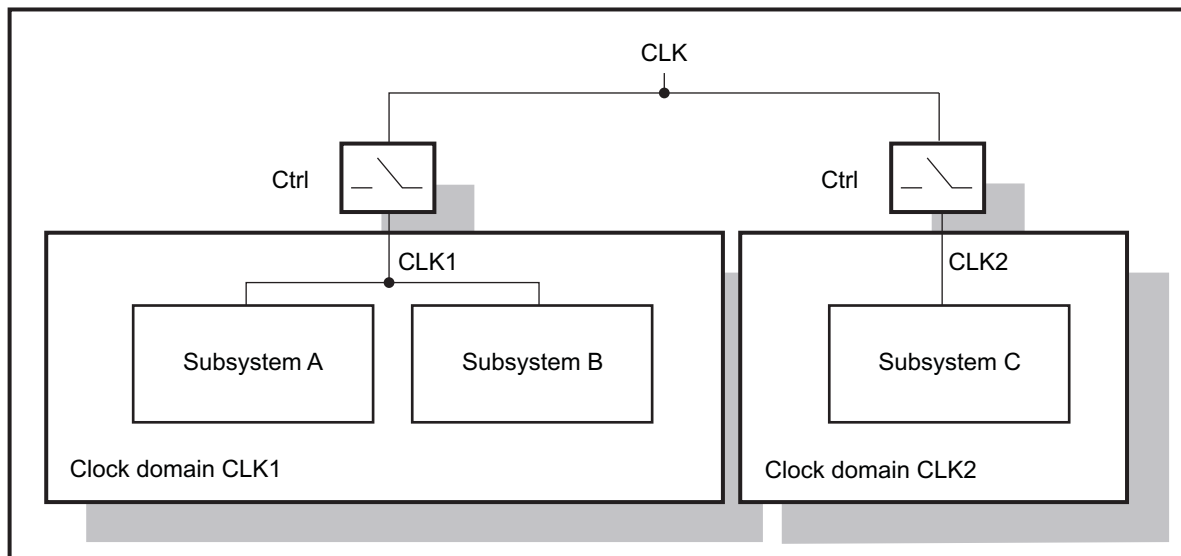

4.1.3 Architectural Blocks for Power Management

The device supports the power-management techniques through three architectural blocks: the power, clock, and voltage domains. A domain is a group of modules or subsections of the device that share a common entity (clock, voltage, or power switching).

4.1.3.1 Clock Domain

A clock domain is a group of modules fed by the same gated clock signal (see Figure 4-4). By gating the clock to each domain, it is possible to cut a clock to a group of inactive modules to lower their active power consumption. Thus, a clock domain allows control of dynamic power consumption by the device.

Figure 4-4. Generic Clock Domain

prcm-005

Table 4-1 lists the two possible states of the clock domain.

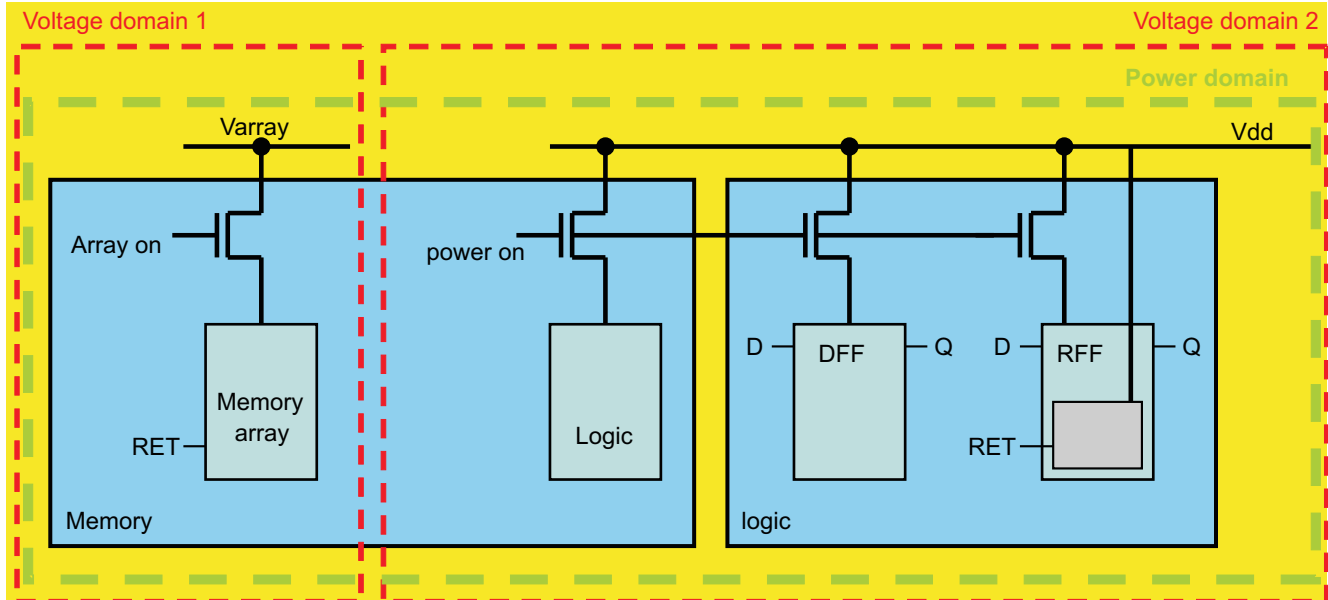

Table 4-1. States of a Clock Domain

State	Description
Active	The domain clock is running.
Idle	The domain clock is stopped or gated.

4.1.3.2 Power Domain

A power domain is a section of the device with independent and dedicated power rails (see Figure 4-5). A power domain can be turned on/off without affecting the other parts of the device.

Figure 4-5. Generic Power Domain

108-093

To minimize device power consumption, the modules are placed in power domains. All power domains embed some logic and some memory. The memory contains a memory array powered by a dedicated voltage rail (Varray + arrayon switch) and some logic powered by the same voltage rail as the power domain logic (VDD + power on switch).

NOTE: The behavior of the Varray, arrayon, and power on switches can be selected by software (PWSTCTRL registers) hardwired; once the selection is made, the switches are handled automatically by the PRCM module.

The power domain logic for the CORE and the PER power domains can be split between retention flip-flops (RFF) or nonretention flip-flops (DFF). All other power domains embed only DFF.

A power domain can be in several power domain states: On, inactive, open/closed switch retention (OSWR, CSWR), or off.

- On: Power on is set to 1; Vdd is provided to the logic (DFF and RFF) and to the memory logic. All the logic is fully working. Depending on the software settings, Varray can keep its active value or be lowered, and the arrayon switch can be open or closed (depending on the power domain, this can be hardwired). As a consequence, the memory content can be accessible, retained, or lost.
- Inactive: The same as power on but all clocks are cut. Logic is not working, because no clock is running.
- Closed-switch retention (CSWR): Power on is set to 1, Vdd is provided to the logic (DFF and RFF) and to the memory logic, but Vdd can be lowered to its retention value. The logic is not functional, but is retained. Depending on software settings, Varray can keep its active value (if needed by another memory array in another power domain), or be lowered, and the arrayon switch can be open or closed (depending on the power domain, this can be hardwired). As a consequence, the memory content can be retained or lost.
- Open-switch retention (OSWR) (CORE and PER power domains only): Power on is set to 0, Vdd, which can be lowered to its retention value, is provided only to the RFF logic. Only the RFF logic is retained. The DFF logic is lost and reset on wakeup. Depending on software settings, Varray can keep its active value (if needed by another memory array in another power domain), or be lowered, and the arrayon switch can be open or closed (depending on the power domain, this can be hardwired). As a

consequence, the memory content can be retained or lost.

- Off: Power on is set to 0, Vdd is usually cut, all the logic (DFF and RFF) is lost, except for the context that has been saved in the scratchpad memory of the WKUP power domain (always on). Varray can keep its active value (if needed by another memory array sharing the same Varray voltage rail in another power domain), be lowered (if all other memory arrays sharing the same Varray voltage rail are set to be in retention), or be cut (0 V) when the entire device is in off mode. The arrayon switch is open and the memory content is lost.

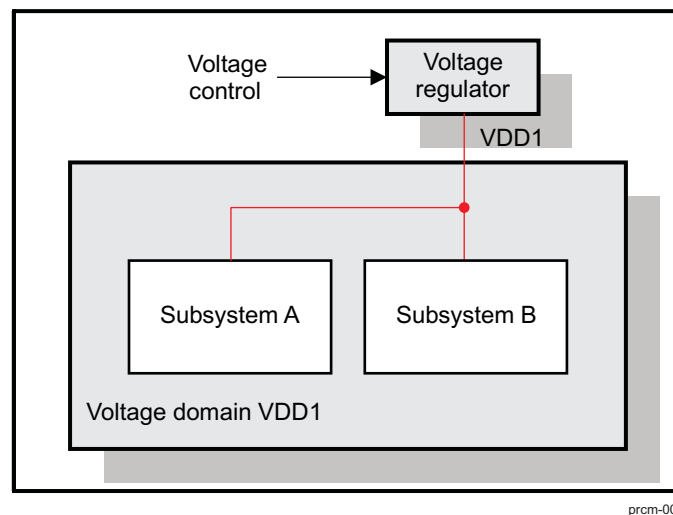

The retention state is useful for quickly switching to low-power idle mode without losing the context, and then quickly switching back to active state when necessary. In retention state, power consumption is less than in normal operating mode.

4.1.3.3 Voltage Domain

A voltage domain is a group of modules supplied by the same voltage regulator (embedded or external). The power consumption of this group can be controlled by regulating its voltage independently.

Figure 4-6 shows the voltage domain.

Figure 4-6. Generic Voltage Domain

By partitioning the device into independent voltage domains, it is possible to assign different operating voltages to the different modules. The independent voltage control allows voltage scaling of device subsections to ensure that each module operates at the optimal operating voltage level based on the application performance requirements. When all modules in a voltage domain are inactive, the domain voltage can be lowered to reduce power consumption and then be switched back to normal operating voltage when a wake-up event is received.

4.1.4 Device Power-Management Architecture

The device architecture integrates the power-management architectural blocks for power-management support. It is composed of scalable/switchable voltage domains (their voltage can be controlled) and switchable power domains. Figure 4-7 shows the general hierarchical architecture scheme of the voltage, power, and clock domains.

A clock domain is a subset of a power domain. This avoids unnecessary dependencies between power domains caused by clocks covering multiple power domains. Each clock in a power domain, with an independent gating control, is a separate clock domain.

Figure 4-7. Voltage, Power, and Clock Domain Hierarchical Architecture

108-008

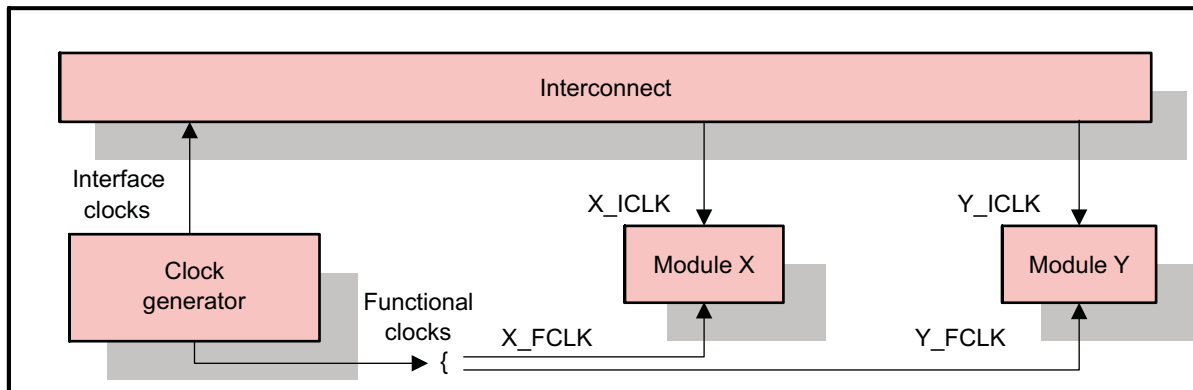

Each power domain is supplied by one or more voltage domains that can be scaled down or switched off to save power. Internal memory and logic can be put in standby (retention) mode independently. In this state, memory is not operational, but the content is retained with minimized leakage. This feature lets power consumption be reduced when the device is in sleep mode while maintaining memory contents for fast context restore. The logic and memory standby feature is software-controllable.

The device supports a clock distribution and control architecture, which is described in the following sections.

4.1.4.1 Module Interface and Functional Clocks

The clocks delivered to the modules in the device are divided into two categories: interface clocks and functional clocks (see Figure 4-8).

Figure 4-8. Functional and Interface Clocks

prcm-009

Interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the module interface and registers.
- A typical module has one interface clock, but it can have several.
- They are synchronous across the entire device, because the interconnect fabric is fully synchronous.
- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is distributed through the device interconnect and is identified with an `_ICLK` suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or a subsystem.
- Each module can have several functional clocks, or none. A module may or may not require its functional clocks to be active (nonidle).
- Several modules can share the same functional clock signals, but the branches of the clock tree are not balanced among the modules.
- From the PRCM module standpoint, a functional clock is directly distributed to the related modules through a dedicated clock tree. It is identified with an `_FCLK` suffix.

NOTE: At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM module. The functional clocks are fed by a PRCM functional clock output or a PRCM interface clock output. In the latter case, the functional and interface clocks of the module inherit capabilities (autoidle features) from the PRCM interface clock (see [Section 4.7, Clock Manager Functional Description](#)).

4.1.4.2 Autoidle Clock Control

The device supports an autoidle clock control scheme for the module interface clocks. With this control scheme, the PRCM module can automatically activate and deactivate the interface clock of any device module, depending on its operating mode. This scheme executes under hardware control and is transparent to the software. This scheme identifies two module types in the device: the target and the initiator modules, or subsystems.

NOTE: The functional clocks do not have the autoidle clock scheme, and the software must gate the functional clock of each module when it is not needed.

Initiator

An initiator can generate bus transactions (read, write, etc.) toward targets. It is considered active when it generates transactions. If it enters standby mode, it stops generating transactions. Because most initiators also support a target port for configuration, they are both targets and initiators. Some examples of initiators are processors, direct memory access (DMA), and memory management unit (MMU).

Target

A target is a passive module that can process bus transactions (read/write to memory-mapped registers). It is considered active when its interface clocks and some or all of its functional clocks are available so it can accept incoming transactions. A target can be put in idle mode by the PRCM module, and in this mode, its interface clock can be gated at any time. An idle module can still receive its functional clocks and generate interrupts and DMA requests. It can also generate asynchronous wake-up requests, if it is wakeup-capable.

Active, Idle, and Standby Modes

The PRCM module handles automatic clock control differently for initiator and target modules.

For the initiator module, the following hardware handshake scheme is employed:

1. The initiator, when switching from active to idle mode, signals its status to the PRCM module.
2. The PRCM module cuts off the interface clock to the initiator module.
3. When the initiator module must reactivate, it signals the PRCM module, which reactivates its functional and interface clocks.

For the target module, the following hardware handshake scheme is employed:

1. When the PRCM module confirms that the target module satisfies the idle conditions, it signals the target module.
2. The target module acknowledges the idle request of the PRCM module, depending on its idle mode internal settings (for details about idle mode settings, see the chapter in the technical reference manual for the corresponding device module):
 - If the module is set to smart-idle mode, it terminates its current operations, then acknowledges the idle request to the PRCM module.
 - If the module is set to force-idle mode, it acknowledges immediately, regardless of its state. Because pending transfers, interrupts, and DMA requests can be lost, special software care must be taken.
 - If the module is set to no-idle mode, it does not acknowledge the idle request. This forces the PRCM module to maintain the clock active.
3. The PRCM module cuts off the module clocks.
4. The target module can be awakened by the PRCM module when its wake-up conditions are satisfied (wake-up event). It activates the module clocks, and then signals the wakeup.
5. The target module acknowledges the wake-up request.
6. Some target modules can support wake-up capability. They can explicitly request the PRCM module to activate their clock.

This automatic clock control ensures reduced dynamic power consumption of the device without any associated software overhead.

4.2 PRCM Overview

This section describes all modules and features in the high-tier device. To check availability of modules and features, see [Section 1.5, OMAP35xx Family](#). To save power, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

4.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current to extend the life of the battery in the end product. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption. The PRCM module, which is the enhanced power-management subsystem of the device, is the central control module for the clock, reset, and power-management signals in the device.

The device supports the power-management techniques with the following features:

- Partitioning of the device into 16 voltage domains and 18 power domains
- Domain isolation that allows any combination of domain on/off states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- Scalable voltage and frequency support for the processors, CORE, and peripherals for DVFS
- Support for low-power device off mode input/output (I/O) pad configuration for minimum power consumption when in off power state

The PRCM module interfaces with all the components of the device for power, clock, and reset management through power-control signals. It integrates enhanced features to let the device adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The PRCM module is composed of two main entities:

- Power reset manager (PRM): Handles power, reset, wake-up management, and system clock source control (oscillator)
- Clock manager (CM): Handles clock generation, distribution, and management

The PRCM module is fully configurable through its L4 interface port.

[Figure 4-9](#) is an overview of the PRCM module and its internal connections with a generic power domain.

Figure 4-9. PRCM Overview

4.2.2 PRCM Features

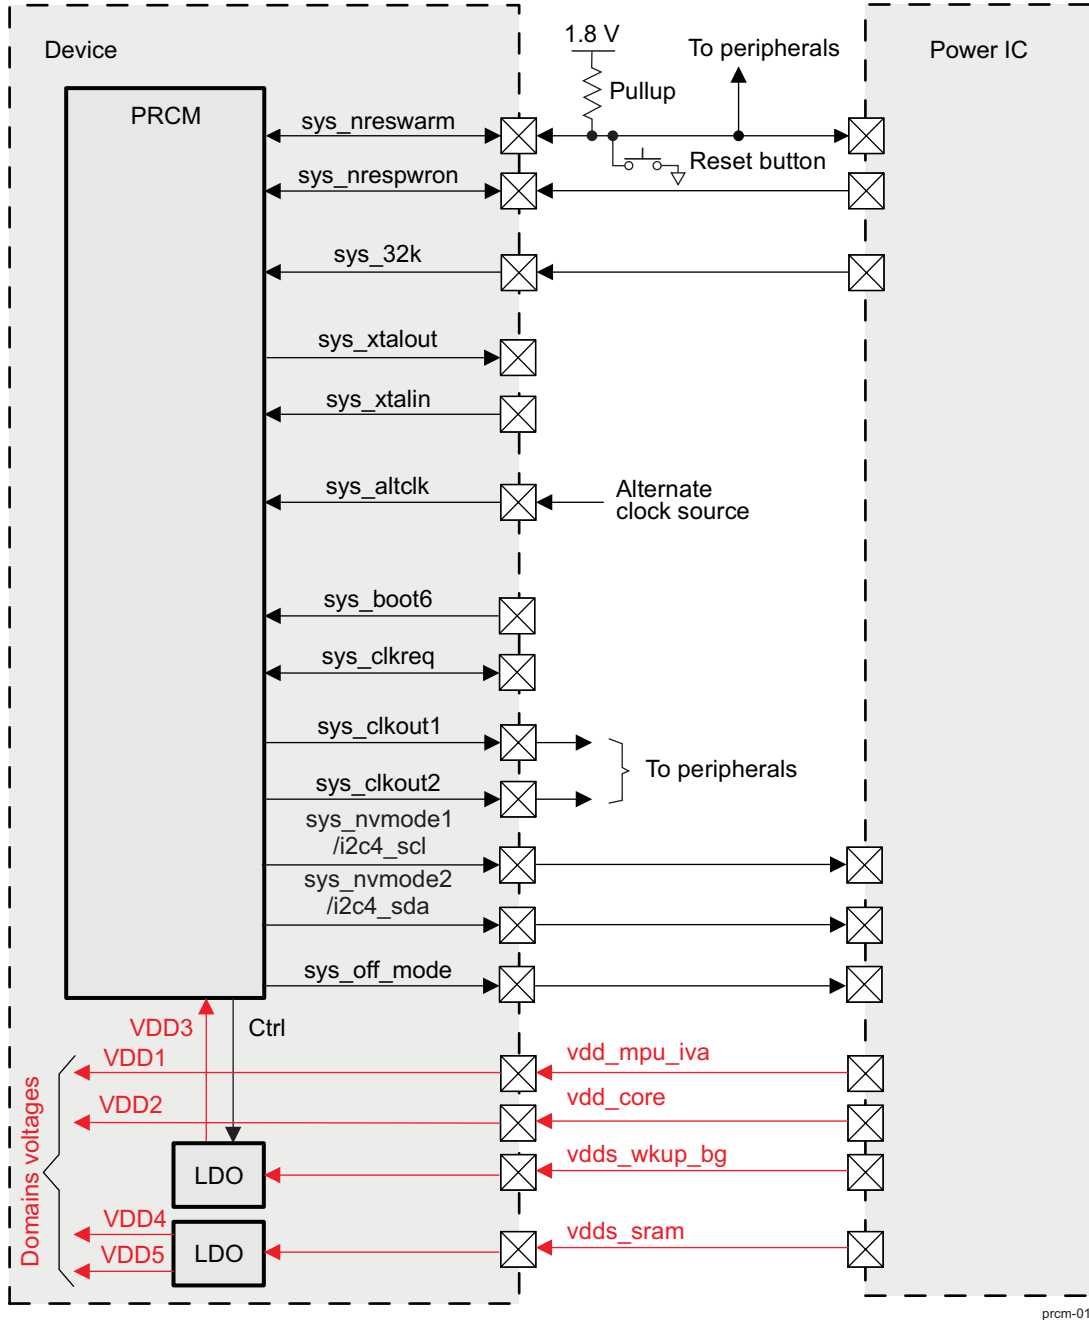

The PRCM module includes the following features:

- Managing 18 independent power domains
- Controlling two scalable and three memory-selectable voltage modes
- Handling idle/wake-up procedures
- Allowing software and partial hardware control
- Monitoring and handling wake-up events
- Controlling system clock/reset input sources
- Managing and distributing clocks and resets with high granularity
- Handling power-up sequences
- Debug and emulation features
- Controlling external supply voltage through dedicated high-speed (HS) I²C interface
- CM implementation of RFFs to support DPS

4.3 PRCM Environment

The PRCM module receives the external reset, clock, and power signals. Figure 4-10 shows the interface of the PRCM module with external reset, clock, and power sources.

Figure 4-10. PRCM Functional External Interface (Detailed View)

NOTE: In the remainder of this chapter, "power IC" refers to a peripheral power source IC that is interfaced with the device. It receives power control commands (voltage scaling and power switching) from the device and provides the necessary voltages and reset signals.

The following sections describe the interfaces for external clock, reset, and power sources.

4.3.1 External Clock Signals

The device has three external clock inputs: low frequency (sys_32k), high frequency (sys_xtalin), and an optional clock (sys_altclk). The device has two configurable clock outputs: sys_clkout1 and sys_clkout2. Figure 4-11 shows the external clock signals of the PRCM module. Table 4-2 lists the external clock signals, I/Os, and module reset values.

Figure 4-11. External Clock Interface

prcm-013

Table 4-2. External Clock Signals

Signal	I/O ⁽¹⁾	Description	Module Reset Value
sys_boot6	I	Boot oscillator mode control	Unknown
sys_32k	I	32-kHz clock input	Unknown
sys_xtalout	O	Oscillator output	0
sys_xtalin	I	Main input clock. Crystal oscillator clock (only at 12, 13, 16.8, or 19.2 MHz) or CMOS digital clock (at 12, 13, 16.8, 19.2, 26, or 38.4 MHz).	Unknown
sys_clkreq	I/O	Clock request to/ from device for system clock	1
sys_clkout1	O	Configurable output clock 1	0
sys_altclk	I	Alternate clock source selectable for universal serial bus (USB) (48 MHz), or NTSC/PAL (54 MHz)	Unknown
sys_clkout2	O	Configurable output clock 2	0

⁽¹⁾ I = Input; O = Output

Figure 4-12 shows the PRCM external clock sources.

Figure 4-12. PRCM External Clock Sources

The system clock source can be either of the following:

- Internal oscillator with crystal connected between sys_xtalin and sys_xtalout
- CMOS digital clock that arrives at the sys_xtalin pin

In the first option, the sys_clkreq signal is used in input mode to control sys_clkout1 and the internal clock oscillator. In the second option, the signal is used in output mode to request the external system clock.

An external pulldown or pullup tied on sys_boot6 determines whether the internal oscillator is used or an external clock source is supplied, respectively.

CAUTION
Only one clock source option can be used at a time.

An alternate clock input (sys_altclk) provides a precise clock source for 54 MHz, 48 MHz, or other frequencies (for example, 59 MHz or 49.04 MHz for VDAC).

For more information about external clock signals, see [Section 4.7.5](#), *External Clock Controls*.

4.3.2 External Reset Signals

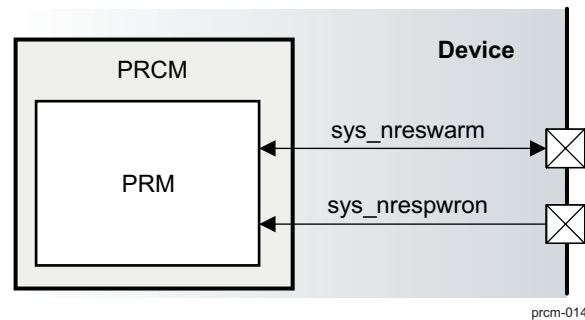

The device supports two reset signals: power-on (sys_nrespwron) and warm reset (sys_nreswarm).

sys_nrespwron is asserted at power up to reset the full logic in the device. sys_nreswarm can be activated at any time by an external device or an external reset push-button action (see [Figure 4-10](#)) to cause a global warm reset event.

Because sys_nreswarm is bidirectional, it can also drive a reset of external devices. Any global warm reset source (for example, a push-button) causes sys_nreswarm to be driven out and maintained for a limited length of time at the boundary of the device. In this way, the device and its related peripherals are reset together.

The sys_nrespwron assertion also causes assertion of sys_nreswarm.

[Figure 4-13](#) shows the external reset signals. [Table 4-3](#) lists the external reset signals, I/Os, and module reset values.

Figure 4-13. External Reset Signals

prcm-014

Table 4-3. External Reset Signals

Signal	I/O ⁽¹⁾	Description	Module Reset Value
sys_nreswarm	I/O	Warm-boot reset	1
sys_nrespwron	I	Power-on reset	Unknown

⁽¹⁾ I = Input; O = Output

NOTE: sys_nrespwron must be kept asserted until the voltage and power domains are ramped up, which depends on the power IC used. At the PRCM boundary, a sys_nrespwron pulse of 1 ns resets the device.

sys_nreswarm assertion is asynchronously sampled in the PRM. It is kept internally asserted.

4.3.3 External Power Signals

The power control signals let the PRCM module control the device voltage levels. The voltage level of the scalable voltage sources in the external power IC can be scaled by sending commands to the power IC through this interface. The PRCM module can also command the power IC to switch the device voltages off when the device is in off mode and activate them when it wakes up.

Figure 4-14 shows the power control interface for the external power IC. Table 4-4 lists the signals, I/Os, and module reset values for the external power IC.

Figure 4-14. Power Control Interface for External Power IC

prcm-015

Table 4-4. Power Control Interface

Signal	I/O ⁽¹⁾	Description	Module Reset Value
sys_nvmode1/i2c4_scl	O	Commands the external power IC for control of VDD1 and VDD2 voltages Shared by the VMODE interface and the dedicated I ² C interface	0x1

⁽¹⁾ I = Input; O = Output

Table 4-4. Power Control Interface (continued)

Signal	I/O ⁽¹⁾	Description	Module Reset Value
sys_nvmode2/i2c4_sda	O	Commands the external power IC for control of VDD1 and VDD2 voltages. Shared by the VMODE interface and the dedicated I ² C interface	0x1
sys_off_mode	O	Requests the external power IC to switch the device voltage level according to the device power status	0x0

4.4 PRCM Integration

The PRCM internal registers can be accessed for configuration and controlled through the WKUP L4 interconnect. In addition to the L4 interconnect, the PRCM internal module interface contains the following:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU subsystem and IVA2.2 subsystem INTCs
- Digital phase-locked loop (DPLL) control commands for recalibration and bypass
- System clock oscillator control for device-level sleep/wake-up transitions

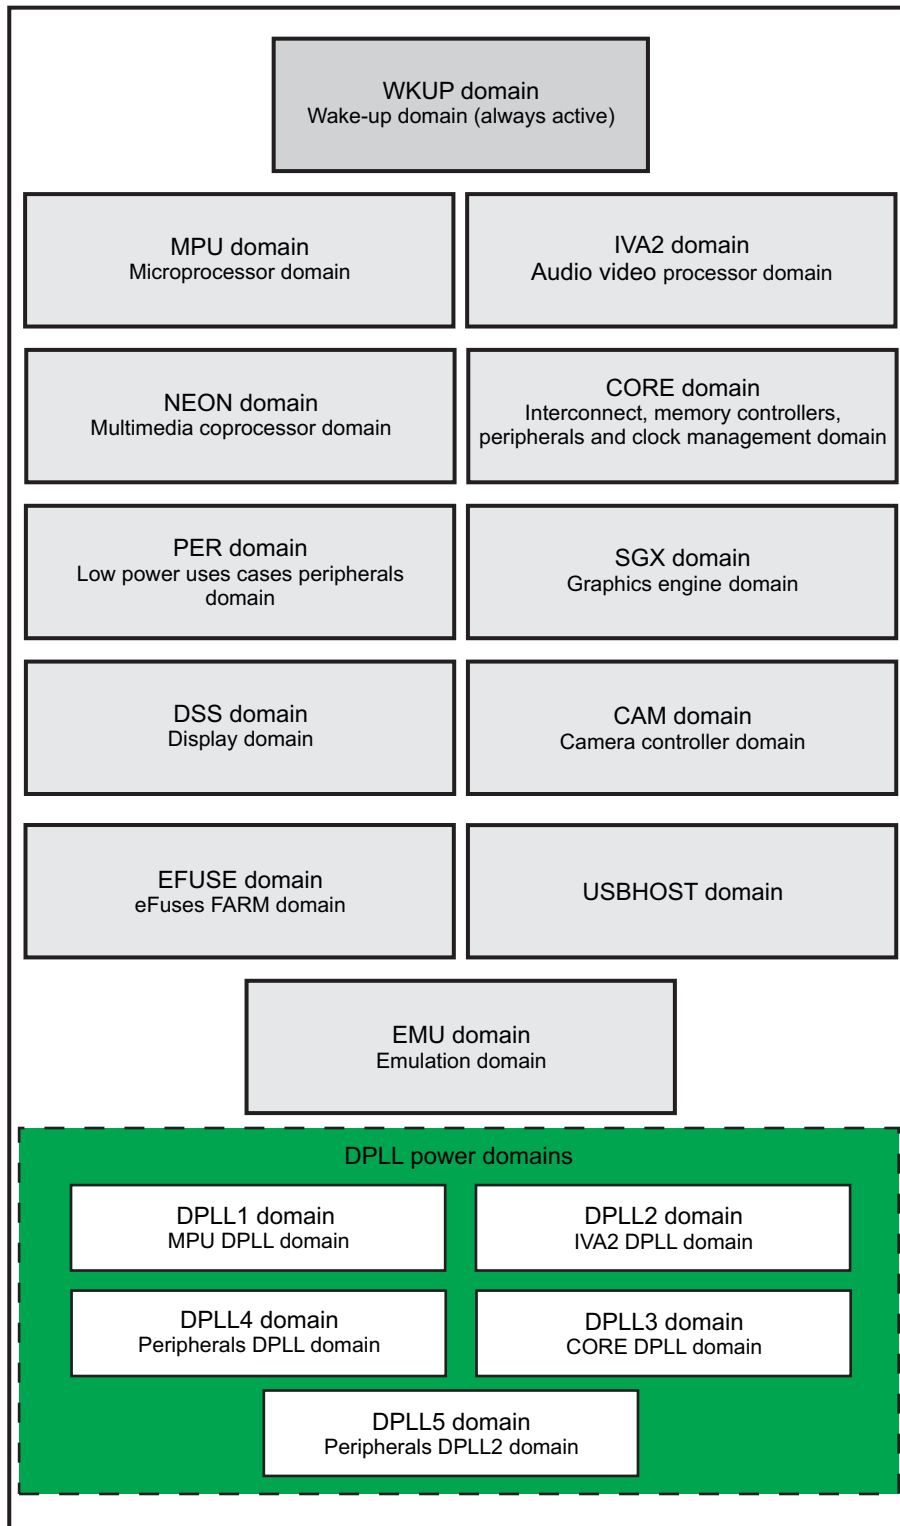

[Figure 4-15](#) shows details of the control interface to a generic power domain.

Figure 4-15. PRCM Integration

To significantly reduce leakage in sleep modes (SLM strategy) and to optimize active power consumption (DPS strategy), the device is segmented into power domains (see Figure 4-16).

Figure 4-16. Device Power Domains

prcm-017

Each power domain is fed through an independent switch controlled by the PRM module. In this way, depending on the application scenario, unused parts (domains) can be switched off or put in retention state while others remain active.

4.4.1 Power-Management Scheme, Reset, and Interrupt Requests

4.4.1.1 Power Domain

The PRCM module is in two power domains (see [Table 4-5](#)).

Table 4-5. PRCM Power Domains

PRCM Subsystem Modules	Power Domain
PRM	WKUP
CM	CORE

The PRM module is in the WKUP power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM module is in the CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

4.4.1.2 Resets

The PRM and CM modules are reset by independent reset signals (see [Table 4-6](#)).

Table 4-6. PRCM Reset Signals

PRCM Subsystem	Reset Signal
PRM	PRM_RSTPWON
CM	CM_RSTPWON_RET

The PRM module is reset by the cold reset signal PRM_RSTPWON. The CM module is reset by assertion of the CM_RSTPWON_RET signal.

The CM logic is reset on:

- Any global cold reset
- A CORE power domain transition from off to on

The PRM logic is reset on any global cold reset.

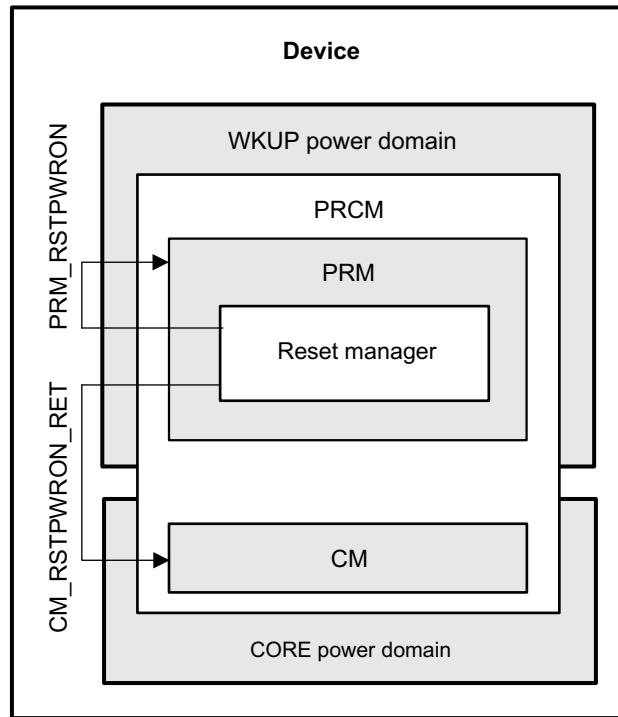

CM and PRM registers that are sensitive to a warm reset are also reset when a global warm reset occurs. However, the CM and PRM logic is not reset.

NOTE: At global cold reset:

- Only the device finite state-machine (FSM) in the PRM operates on the 32-kHz clock, and it is released from reset on the release of the global reset.
 - PRM logic operates on the system clock and is released from reset on release of the reset PRM_RSTPWON.
-

[Figure 4-17](#) shows the PRCM reset signals.

Figure 4-17. PRCM Reset Signals

prcm-018

4.4.1.3 Interrupt Requests

The PRCM module can generate two interrupts:

- PRCM_MPU_IRQ: Mapped to the MPU INTC module (M_IRQ_11 interrupt line)
- PRCM_IVA_IRQ: Mapped to the IVA2.2 WUGEN module (IVA2_IRQ[12] interrupt line)

4.5 PRCM Reset Manager Functional Description

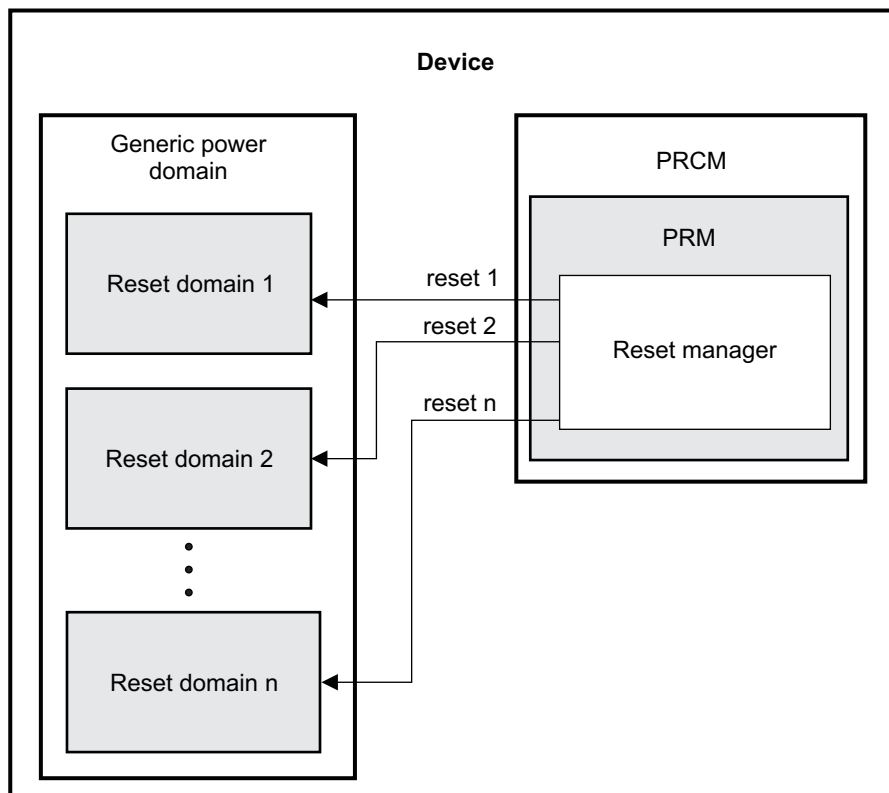

4.5.1 Overview

The PRCM module manages the reset of all modules in the device. Resets are distributed across the independent power domains (including DPLLs).

In each power domain, one or more reset domains are defined. A reset domain is defined by a unique reset signal that originates from the reset manager and is connected to one or more modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing the release of resets and ensures a safe reset of the entire power domain.

Figure 4-18 is an overview of the reset manager interface with a generic power domain in the device.

Figure 4-18. Reset Manager Interface With Generic Power Domain

prcm-019

Resets can be generated by hardware sources or software control. For a module that can be reset by software control, a software-reset bit is implemented in its <module name>_SYSCONFIG configuration register. Software reset has the same effect on the module logic as a hardware reset.

Special reset control is available to reset specific reset domains when the device operates under emulation control.

NOTE: All reset assertion is asynchronous, and all reset signals are active low, except for the DPLL reset signals, which are active high.

4.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on three criteria:

- Scope
- Occurrence

- Source type

4.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by that reset):

- Global reset: Affects the entire device; all modules are reset. Generally, occurs when the device powers up or an abnormal operation is detected (the eFuse bad device is detected, etc.).
- Local reset: Affects one power or reset domain. Generally, when a power domain transitions from off mode to active mode, or when a software-reset control bit for a domain is set, only the group of modules within that domain is affected.

4.5.2.2 Occurrence

A reset signal can be categorized depending on when the reset occurs:

- Cold reset: Occurs only on device power up or in certain emulation modes. The cold reset is a global reset that affects every module in the device. It usually corresponds to the initial power-on reset.
- Warm reset: Occurs when the device is in normal operating state. The warm reset is also a global reset, but it does not affect all the modules in the device. Usually, the device does not require a complete reboot on a warm reset. Several reset sources, such as the global software reset and the watchdog reset, are warm resets.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

For a global warm reset, the PRCM module performs the following sequence:

1. Applies a warm reset on all the modules, including modules built with RFFs.
2. Applies a warm reset on the external modem interface.
3. Drives the sys_nreswarm reset output low and holds it for a specified length of time (programmed in the PRCM.PRM_RSTTIME[7:0] RSTTIME1 bit field).
4. All ongoing transactions on the voltage control I²C interface (I2C4 module) are aborted, and the external power IC is expected to return to nominal voltage values on receiving a sys_nreswarm reset.
5. All power domains that are in off power mode are switched to on power mode.

A global warm reset does not apply to the following modules of the device:

- SDRC
- System control module (SCM) (I/O control)
- Part of PRM and CM registers (see note below)
- 32-kHz synchronization timer
- DPLL3 (see [Section 4.5.9.2](#))
- Emulation modules
- eFuse farm

NOTE: For information about the PRCM registers affected by the global warm reset, see the register mapping summary tables in [Section 4.14](#), *PRCM Register Manual*.

4.5.2.3 Source Type

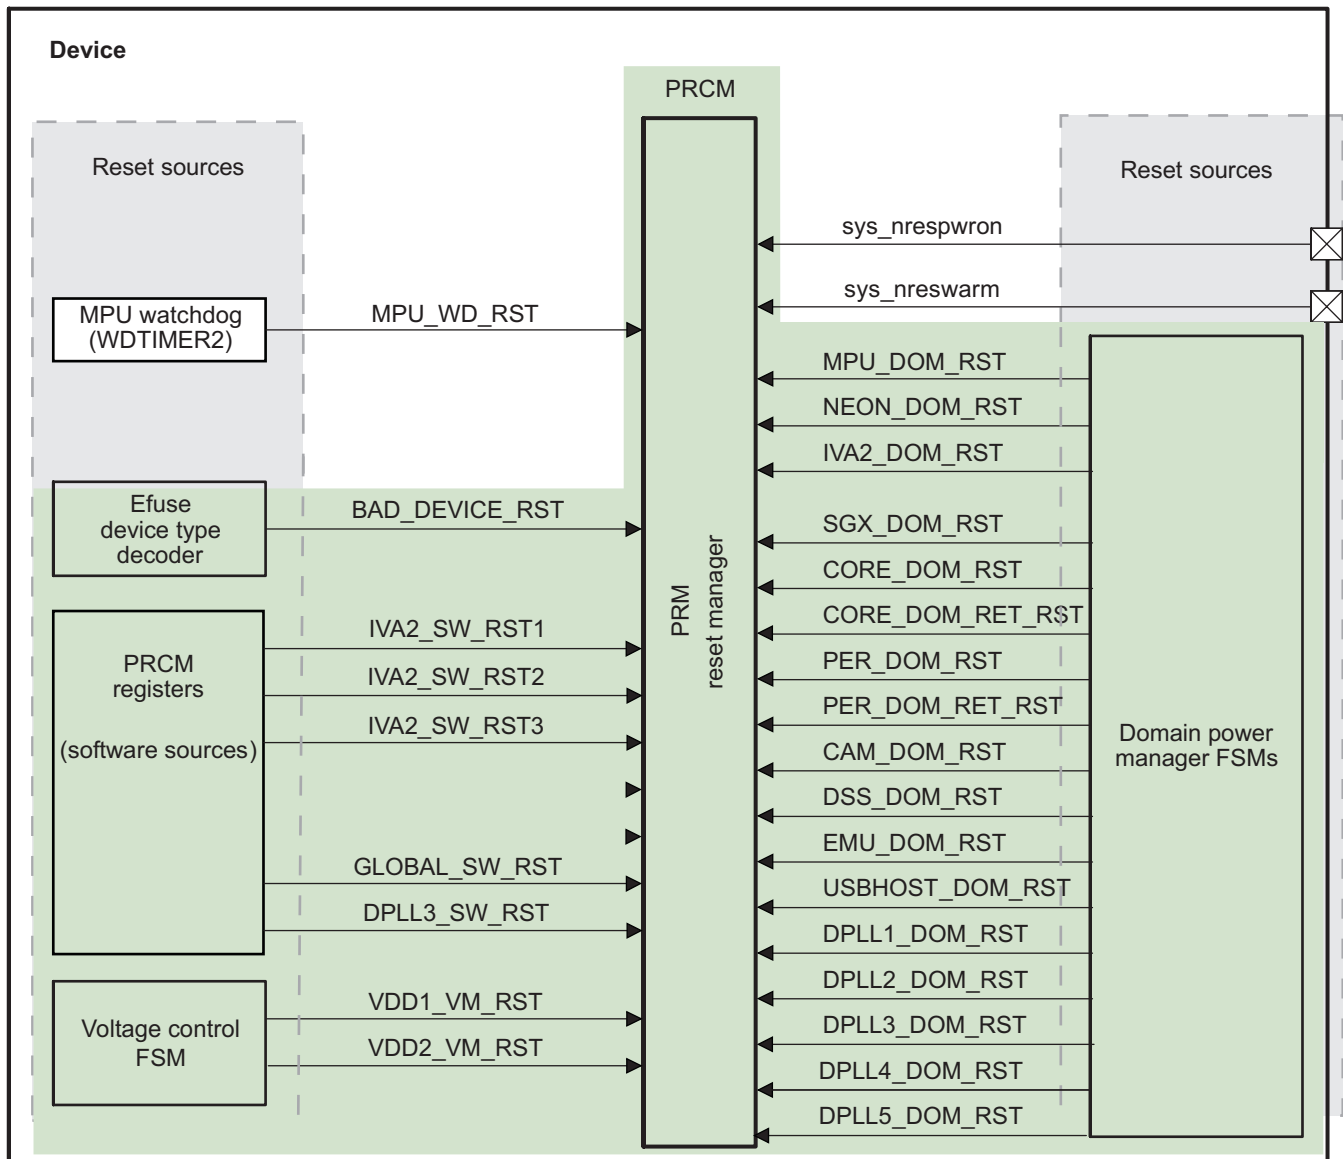

A reset can be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module
- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

4.5.3 Reset Sources

[Figure 4-19](#) is an overview of the reset sources.

Figure 4-19. Reset Sources Overview

*The green region in the figure represents the boundary of the PRCM.

prcm-020

4.5.3.1 Global Reset Sources

Table 4-7 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the reset triggering bit is identified.

Table 4-7. Global Reset Sources

Type ⁽¹⁾	Name	Source/Control	Description
H/C	sys_nrespwron	Input pin	The entire device is reset on power up.
H/C	BAD_DEVICE_RST	PRCM	Asserted when during the power-up sequence the device is identified as bad, after reading eFuses
H/W	sys_nreswarm	Bidirectional pin	External hardware warm reset

⁽¹⁾ H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

Table 4-7. Global Reset Sources (continued)

Type ⁽¹⁾	Name	Source/Control	Description
H/W	MPU_WD_RST	WDTIMER2	MPU watchdog timer overflow reset
S/W	GLOBAL_SW_RST	PRCM.PRM_RSTCTRL[1] RST_GS	Global software reset
H/W	VDD1_VM_RST	PRCM	Asserted by the voltage manager FSMs when no response from the power IC is received during wake-up transition from retention or off mode
H/W	VDD2_VM_RST	PRCM	
S/W	DPLL3_SW_RST	PRCM.PRM_RSTCTRL[2] RST_DPLL3	Local cold reset for DPLL3 and a global cold reset to the device

4.5.3.2 Local Reset Sources

Table 4-8 lists the local reset sources of the device. A local reset source signal received by the reset manager resets only some of the device modules.

Table 4-8. Local Reset Sources

Type ⁽¹⁾	Name	Source/Control	Description
H/C	CORE_DOM_RET_RST	PRCM	Asserted only for a power domain state transition from off to active state
H/C	USB_DOM_RET_RST	PRCM	
H/C	PER_DOM_RET_RST	PRCM	
H/C	MPU_DOM_RST	PRCM	Asserted for any power domain transition from off or retention state to active state
H/C	IVA2_DOM_RST	PRCM	
H/C	NEON_DOM_RST	PRCM	
H/C	SGX_DOM_RST	PRCM	
H/C	CORE_DOM_RST	PRCM	
H/C	PER_DOM_RST	PRCM	
H/C	CAM_DOM_RST	PRCM	
H/C	DSS_DOM_RST	PRCM	
H/C	DPLL1_DOM_RST	PRCM	
H/C	DPLL2_DOM_RST	PRCM	
H/C	DPLL3_DOM_RST	PRCM	
H/C	DPLL4_DOM_RST	PRCM	
H/C	DPLL5_DOM_RST	PRCM	
S/W	IVA2_SW_RST1	PRCM.RM_RSTCTRL_IVA2[0] RST1_IVA2	IVA2.2: DSP reset control
S/W	IVA2_SW_RST2	PRCM.RM_RSTCTRL_IVA2[1] RST2_IVA2	IVA2.2: MMU reset control and video sequencer hardware accelerator reset control
S/W	IVA2_SW_RST3	PRCM.RM_RSTCTRL_IVA2[2] RST3_IVA2	Video sequencer reset control

⁽¹⁾ H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

NOTE:

- For power domains with <domain name>_DOM_RST and <domain name>_DOM_RET_RST, the reset sources are asserted together when the domain transitions from off to on power state, whereas only <domain name>_DOM_RET_RST is asserted on a global or local warm reset.
- Because the modem reset signals are not supported in the device stand-alone configuration, they are not discussed in this section.

4.5.4 Reset Distribution

Each power domain can contain one power-on reset (RSTPWRON) and one or more reset (RST) signals. These signals behave as follows:

- On any global or local cold reset, RST and RSTPWRON are asserted.
- On any global or local warm reset, only RST is asserted.

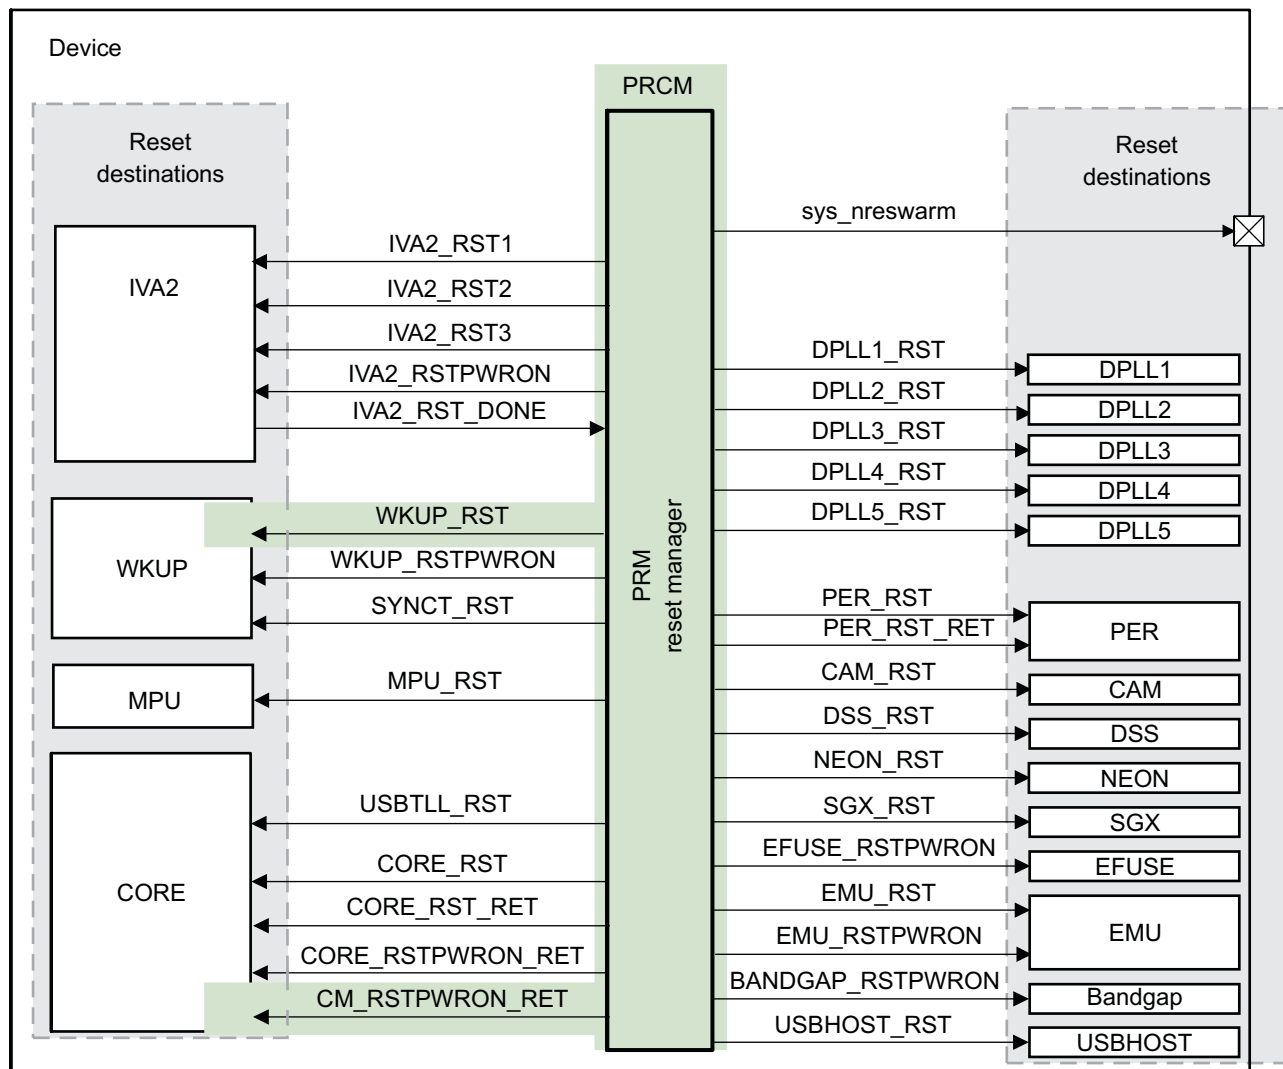

The CORE power domain receives two additional retention logic reset signals: retention reset (RST_RET) and power-on retention reset (RSTPWRON_RET). These signals behave as follows:

- On any global cold reset or wakeup from off state to active state, RST_RET and RSTPWRON_RET are asserted.
- On any global warm reset, only RST_RET is asserted.
- On wakeup from retention state, these signals are not asserted.

The IVA2 power domain outputs the IVA2_RST_DONE signal, which handles the synchronous reset scheme of the IVA2.2 subsystem.

Figure 4-20 shows the reset distribution among the power domains.

Figure 4-20. Reset Destination Overview

* The green region in the figure represents the boundary of the PRCM

prcm-021

4.5.5 Power Domain Reset Descriptions

4.5.5.1 MPU Power Domain

The MPU power domain has one reset output signal (see [Table 4-9](#)).

Table 4-9. MPU Power Domain Reset Signal

Name	I/O ⁽¹⁾	Source/Destination ⁽²⁾	Reset Domain
MPU_RST	I	PRM	Resets the MPU processor core and the asynchronous bridge in the MPU power domain

⁽¹⁾ I = Input; O = Output

⁽²⁾ Source for an input signal and destination for an output signal

4.5.5.2 NEON Power Domain

The NEON power domain has one reset input signal (see [Table 4-10](#)).

Table 4-10. NEON Power Domain Reset Signal

Name	I/O ⁽¹⁾	Source	Reset Domain
NEON_RST	I	PRM	Resets the NEON coprocessor

⁽¹⁾ I = Input; O = Output

4.5.5.3 IVA2 Power Domain

The IVA2 power domain has four inputs and one output reset signal (see [Table 4-11](#)).

Table 4-11. IVA2 Power Domain Reset Signals

Name	I/O ⁽¹⁾	Source/Destination ⁽²⁾	Reset Domain
IVA2_RST1	I	PRM	Resets the IVA2.2 DSP and part of the two asynchronous bridges in the IVA2 power domain
IVA2_RST2	I	PRM	Resets the IVA2.2 MMU
IVA2_RST3	I	PRM	Resets the video sequencer module
IVA2_RSTPWRON	I	PRM	Performs a power-on reset on the IVA2.2 subsystem. Active on a cold reset only.
IVA2_RSTDONE	O	PRM	Release condition of the IVA_RST1 and RST2. Generated by the IVA2.2 subsystem at the end of the initialization sequence.

⁽¹⁾ I = Input; O = Output

⁽²⁾ Source for an input signal and destination for an output signal

4.5.5.4 CORE Power Domain

The CORE power domain has eight inputs and one output reset signal (see [Table 4-12](#)).

Table 4-12. CORE Power Domain Reset Signals

Name	I/O ⁽¹⁾	Source/Destination ⁽²⁾	Reset Domain
CORE_RST	I	PRM	Resets parts of the three asynchronous bridges, MPU INTC, IVA2.2 WUGEN, interconnects, ICR, modem INTC, SAD2D, mailboxes, GPMC, OCM, UART[1,2], HDQ, HS USB, I2C[1..3], McBSP 1 and 5, McSPI [1..3], MMC[1..3], GPTIMER[10,11]
CORE_RST_RET	I	PRM	Resets part of the SDRC, SDMA, SMS, MPU INTC, and IVA2 WUGEN
CORE_RSTPWRON_RE T	I	PRM	Resets part of the SDRC and SCM
CM_RSTPWRON_RET	I	PRM	Resets the clock manager

⁽¹⁾ I = Input; O = Output

⁽²⁾ Source for an input signal and destination for an output signal

Table 4-12. CORE Power Domain Reset Signals (continued)

Name	I/O ⁽¹⁾	Source/Destination ⁽²⁾	Reset Domain
USBTLL_RST	I	PRM	Resets the USB TLL asynchronously

The CM logic is reset on:

- Any global cold reset
- A CORE power domain transition from off to on

Because the CM logic is not reset in this case, CM registers that are sensitive to a warm reset must also be reset synchronously with the L4 clock when a global warm reset occurs.

4.5.5.5 DSS Power Domain

The DSS power domain has one reset input signal (see [Table 4-13](#)).

Table 4-13. DSS Power Domain Reset Signal

Name	I/O ⁽¹⁾	Source	Reset Domain
DSS_RST	I	PRM	Resets the entire display subsystem

⁽¹⁾ I = Input; O = Output

4.5.5.6 CAM Power Domain

The CAM power domain has one reset input signal (see [Table 4-14](#)).

Table 4-14. CAM Power Domain Reset Signal

Name	I/O ⁽¹⁾	Source	Reset Domain
CAM_RST	I	PRM	Resets the entire camera subsystem

⁽¹⁾ I = Input; O = Output

4.5.5.7 USBHOST Power Domain

The USBHOST power domain has one reset input signal (see [Table 4-15](#)).

Table 4-15. USBHOST Power Domain Reset Signal

Name	I/O ⁽¹⁾	Source	Reset Domain
USBHOST_RST	I	PRM	Resets the entire HS USB host subsystem

⁽¹⁾ I = Input; O = Output

4.5.5.8 SGX Power Domain

The SGX power domain has one reset input signal (see [Table 4-16](#)).

Table 4-16. SGX Power Domain Reset Signal

Name	I/O ⁽¹⁾	Source	Reset Domain
SGX_RST	I	PRM	Resets the entire SGX subsystem

⁽¹⁾ I = Input, O = Output

4.5.5.9 WKUP Power Domain

The WKUP power domain has three reset input signals and two reset output signals (see [Table 4-17](#)).

Table 4-17. WKUP Power Domain Reset Signals

Name	I/O ⁽¹⁾	Source/Destination ⁽²⁾	Reset Domain
WKUP_RST	I	PRM	Resets the GPTIMER1, WDTIMER2, GPIO 1
WKUP_RSTPWRON	I	PRM	Resets the wake-up control module
MPU_WD_RST	O	PRM	Global warm reset for PRM. Generated by WDTIMER2.

⁽¹⁾ I = Input; O = Output

⁽²⁾ Source for an input signal and destination for an output signal

The PRM logic is reset on any global cold reset. Because the PRM logic is not reset in this case, PRM registers that are sensitive to a warm reset must also be reset synchronously with the system clock when a global warm reset occurs.

4.5.5.10 PER Power Domain

The PER power domain has two reset input signals (see [Table 4-18](#)).

Table 4-18. PER Power Domain Reset Signal

Name	I/O ⁽¹⁾	Source	Reset Domain
PER_RST	I	PRCM	Resets the UART3, McBSP[2,3,4], GPTIMER[2,...,9], WDTIMER3 modules
PER_RST_RET	I	PRCM	Resets the GPIO [2,...,6] modules

⁽¹⁾ I = Input; O = Output

4.5.5.11 DPLL Power Domains

The DPLL power domains for DPLL1, DPLL2, DPLL3, DPLL4, and DPLL5 each have one reset input signal.

Table 4-19. DPLL Power Domain Reset Signals

Name	I/O ⁽¹⁾	Source	Reset Domain
DPLL1_RSTPWRON	I	PRCM	Resets DPLL1
DPLL2_RSTPWRON	I	PRCM	Resets DPLL2
DPLL3_RSTPWRON	I	PRCM	Resets DPLL3
DPLL4_RSTPWRON	I	PRCM	Resets DPLL4
DPLL5_RSTPWRON	I	PRCM	Resets DPLL5

⁽¹⁾ I = Input; O = Output

They are asserted for any type of global cold reset.

4.5.5.12 EFUSE Power Domain

The EFUSE power domain has one reset input signal (see [Table 4-20](#)).

Table 4-20. EFUSE Power Domain Reset Signal

Name	I/O ⁽¹⁾	Source	Reset Domain
EFUSE_RSTPWRON	I	PRCM	Resets the eFuse controller

⁽¹⁾ I = Input; O = Output

This signal is asserted for any type of global cold reset and when the device wakes up from off mode.

4.5.5.13 BANDGAP Logic

The BANDGAP logic has one reset input signal (see [Table 4-21](#)).

Table 4-21. BANDGAP Logic Reset Signal

Name	I/O ⁽¹⁾	Source	Reset Domain
BANDGAP_RSTPWON	I	PRCM	Resets the BANDGAP logic

⁽¹⁾ I = Input; O = Output

This signal is asserted for any type of global cold reset and when the device wakes up from off mode.

4.5.5.14 External Warm Reset Assertion

Figure 4-21 shows the external warm reset interface.

Figure 4-21. External Warm Reset Interface

Any global reset source (internal or external) causes `sys_nreswarm_out` to be driven and maintained at the boundary of the device for at least the amount of time configured in the PRCM.`PRM_RSTTIME[7:0]` `RSTTIME1` bit field. This ensures that the device and its related peripherals are reset together.

NOTE: Because the system warm-reset output is implemented on a bidirectional pad, any input pulse on `sys_nreswarm` causes a global warm reset.

4.5.6 Reset Logging

A reset of the device is logged in two ways. First, dedicated registers in the PRCM module (the `RM_RSTST_power domain` and `PRM_RSTST` registers) log the reset source. Second, the SCM logs the device reset activity in dedicated registers.

4.5.6.1 PRCM Reset Logging Mechanism

The reset status registers (`RM_RSTST_power domain` and `PRM_RSTST`) are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (the `RM_RSTST_<power domain> [0] GLOBALCOLD_RST` bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset was asserted and then released, but a global cold reset source was asserted before the release of the domain reset signal.

4.5.6.2 SCM Reset Logging

The PRM exports reset activity status signals to the SCM. The SCM uses these signals to log a reset status in the SCM.CONTROL_SEC_STATUS register. The reset activity status signal is asserted high when any source of reset to the power domain is active.

It also provides reset status for the following global reset signals:

- Global cold reset
- Global warm reset

There is one reset activity status signal for each of the following power domains:

- CAM
- CORE
- DSS
- EMU
- SGX
- IVA2
- MPU
- NEON
- PER
- USBHOST

These signals are asserted high on assertion of any source of reset on the domain and logged. For information about the SCM, see [Chapter 7, System Control Module](#).

4.5.7 Reset Management Overview

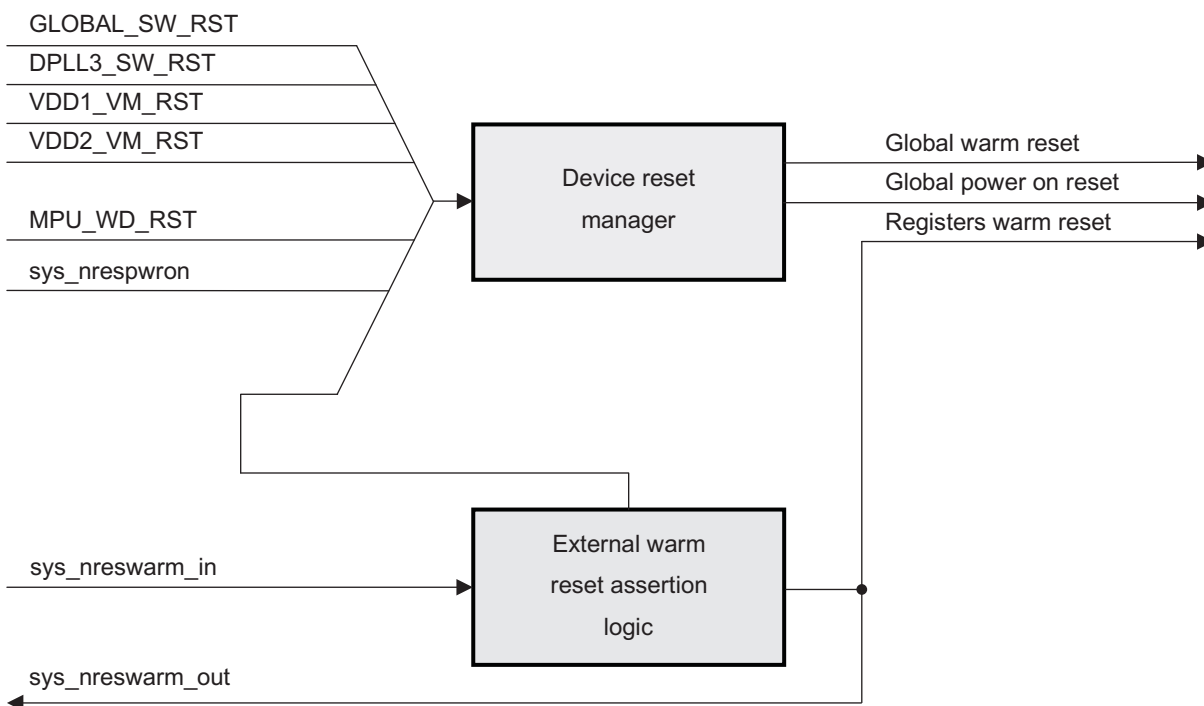

Reset management in the device is a 2-layered structure composed of multiple instances of the reset manager. In the first layer, a top-level reset manager, called the device reset manager, handles all sources of global reset (cold and warm). It provides reset managers for the second layer, called local reset managers, and the global reset and global power-on reset signals.

Each power domain has a minimum of one local reset manager. The local reset manager also receives resets, such as the software reset and domain power transition reset, from the local reset source for the power domain.

[Figure 4-22](#) through [Figure 4-25](#) provide an overview of reset management in the device. They do not provide reset sequencing between the reset managers.

NOTE: The power domain must be ready (the domain clocks must be active) before its reset is released.

4.5.9 Reset Sequences

4.5.9.1 Power-Up Sequence

Figure 4-26 shows the power-up sequence.

Figure 4-26. Power-Up Sequence

prcm-096

The power-up sequence shown in Figure 4-26 is:

1. Voltages ramp up and global power-on reset is asserted by the external power IC:
 - vdds, vdds_mem, vdds_wkup_bg, vdds_sram voltage rails are ramped up.

- sys_nrespwron is asserted (set to low).
 - vdds_dppll_dll and vdds_dppll_per voltage rails are ramped up before release of sys_nrespwron (transition to high).
 - The VDD3 voltage domain LDO (WKUP power domain) tracks vdds_wkup voltage rail and automatically ramps up.
 - After VDD3 voltage domain stabilization, the power IC ramps up VDD2 voltage domain.
 - After VDD2 voltage domain stabilization, the power IC ramps up VDD1 voltage domain.
2. Source clock stabilizes:
 - The 32-kHz input clock and the system clock oscillator stabilize.
 - The device reset manager holds the entire device under reset.
 - The system clock (SYS_CLK) is on.
 3. The global power-on reset sys_nrespwron released (to high) when vdds_dppll_dll and vdds_dppll_per voltage rails are stabilized.
 4. The eFuse farm reset is released.
 5. Internal memory LDOs ramp up:
 - Processor memory LDO (VDD4 voltage domain) is ramped up.
 - CORE memory LDO (VDD5 voltage domain) is ramped up.
 - The PRCM module waits for internal memory LDO stabilization.
 6. Global resets are released. Global power-on reset and global warm reset are extended (remain asserted) on release of the external power-on reset until the following conditions are met:
 - Voltages are stable in the processor power domains, CORE power domain, and WKUP power domain.
 - System clock is stable.
 - Internal memory LDO is stable.
 - Device reset manager counter overflows (set up by the PRCM.PRM_RSTTIME[7:0] RSTTIME1 bit field).
 - Hardware conditions, such as eFuse farm ready, are set.
 7. The PRM_RSTPWON reset is released.
 8. The CM_SYS_CLK clock starts running (gating logic is enabled).
 9. The CM_RSTPWON_RET reset is released.
 10. The reset of the DPLLs is released.
 11. The DPPLL3_ALWON_FCLK clock starts to run (gating logic is enabled).
 12. The L3_ICLK clock starts to run.
 13. The DPPLL1_ALWON_FCLK clock starts to run (logic controlling the clock-gating conditions element is clocked and the clock is requested).
 14. The CORE_RST reset is released.
 15. The MPU_CLK clock starts to run.
 16. The MPU boots.

NOTE:

- The IVA2 power domain is held under reset after power up by assertion of the software source of reset.
 - Power domains such as DSS, CAM, SGX, and NEON are held under reset after power up until the MPU software enables the power domain interface clocks.
-

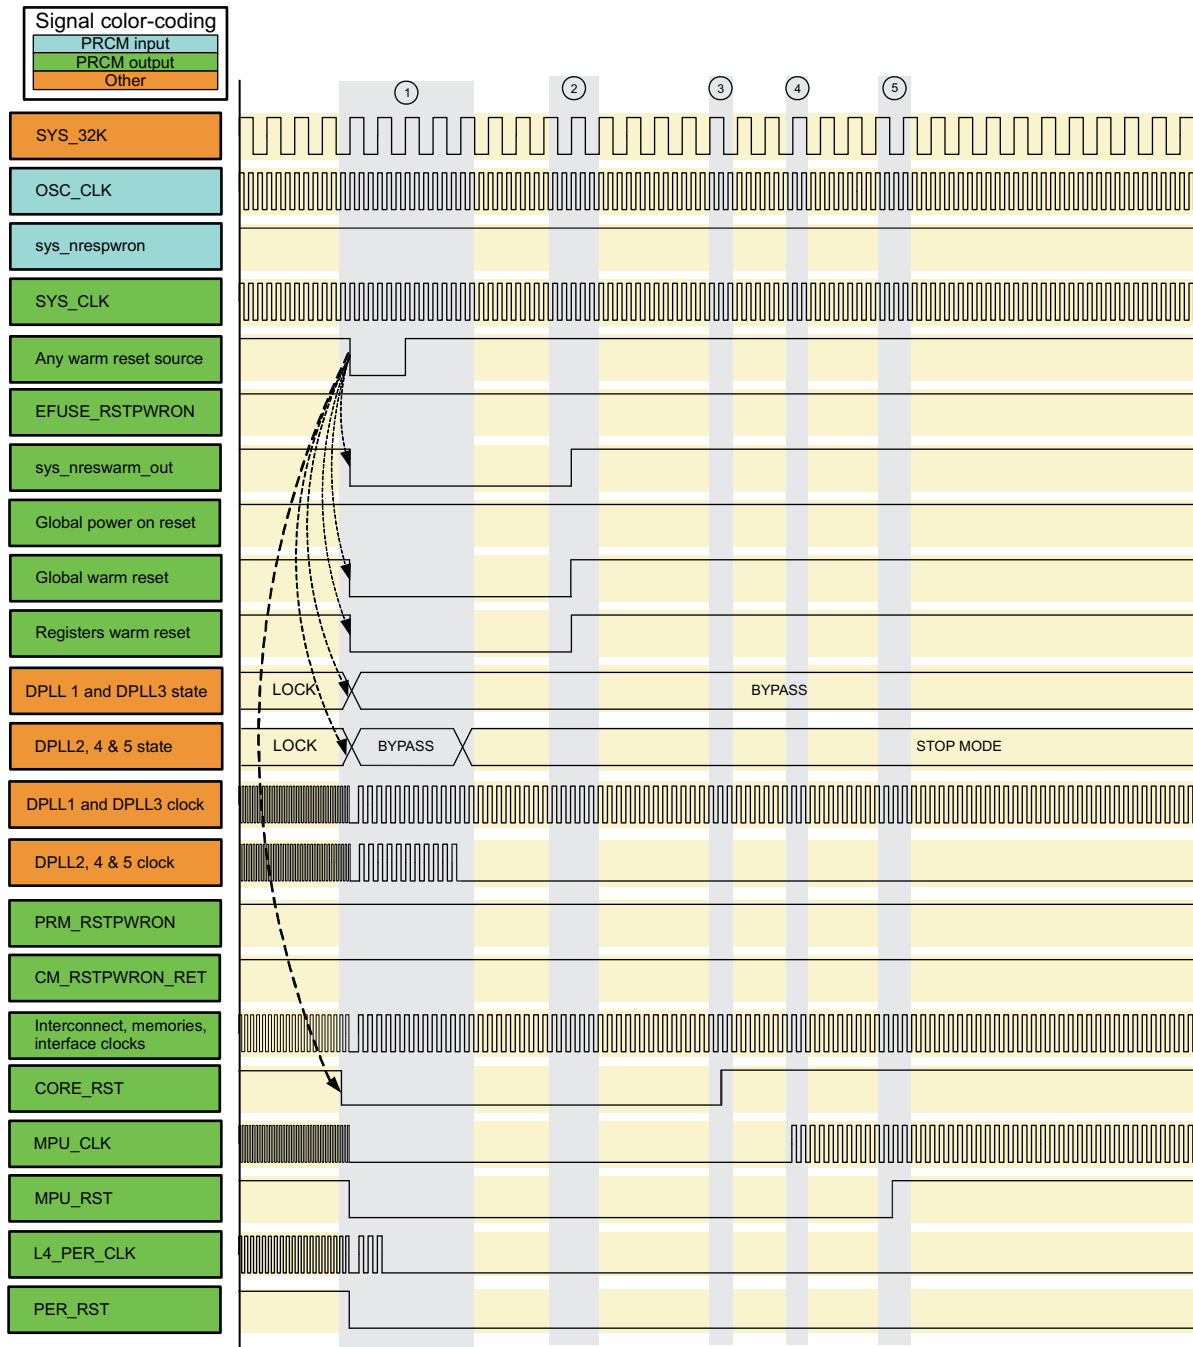

4.5.9.2 Global Warm Reset Sequence

This section describes the global reset sequence.

The assumptions are:

- vdds, vdds_mem, vdds_dpll_pll, vdds_dpll_per, vdds_wkup_bg and vdds_sram power rails are regulated at 1.8 V.
- The VDD2 voltage domain (vdd_core power rail) is regulated at 1.0 V.
- The VDD1 voltage domain (vdd_mpu_iva power rail) is regulated at 1.2 V.
- The VDD3, VDD4, and VDD5 voltage domains are regulated at 1.2 V.
- The system is running:
 - Resets are released.
 - CORE DPLL and processor DPLL are locked.

[Figure 4-27](#) shows the global warm reset sequence.

Figure 4-27. Warm Reset Sequence

prcm-097

The steps of a global warm reset sequence are as follows:

1. On assertion of the warm reset source:
 - The device reset manager resets part of the device by asserting the global warm reset.
 - The external warm reset (sys_nreswarm_out) is asserted.
 - All the power domain warm resets are asserted.
 - DPLL1 and DPLL3 transit to bypass mode. DPLL2, DPLL4, and DPLL5 transit to stop mode. The system clock, SYS_CLK, continues running at system clock frequency.
 - The registers sensitive to a warm reset are synchronously reset (PRM and CM register sets).
 - The CM cuts all the clocks not requested, according to the register reset value settings.

2. The global warm reset is released and extended after release of the warm reset source until the following conditions are met:
 - Device reset manager counter overflows (set up by the PRCM.PRM_RSTTIME[7:0] RSTTIME1 bit field).
 - Voltage domains (VDD1, VDD2, VDD4 and VDD5) are stable.
-

NOTE: Voltage stabilization is an additional condition if voltage scaling was performed before the assertion of the warm reset.

3. The CORE domain is released from reset (warm sensitive modules in CORE power domain).
 4. The MPU_CLK clock is running.
 5. The MPU power domain is released from reset. The MPU boots.
-

NOTE:

- The IVA2 power domain is held under reset after global warm reset by assertion of the software source of the reset.
 - Power domains such as PER, DSS, CAM, SGX, and NEON are held under reset after global warm reset until the MPU software enables their interface clock.
-

4.5.9.3 IVA2.2 Subsystem Power-Up Sequence

This section describes the power-up reset sequence and timing relationships of the IVA2.2 subsystem.

The assumptions are:

- The MPU is running.
- All sources of reset to the IVA2.2 subsystem are released except for the software sources of reset.

[Figure 4-28](#) shows the IVA2.2 power-up sequence.

Figure 4-28. IVA2.2 Subsystem Power-Up Reset Sequence

prcm-029

The sequence is:

1. Software enables the IVA2.2 subsystem clock.

2. Software clears the PRCM.RM_RSTCTRL_IVA2[1] RST2_IVA2 bit. The PRM module releases the IVA2_RSTPWRON reset signal when reset manager 2 in the IVA2 power domain times out.
3. On release of IVA2_RSTPWRON, the IVA2.2 subsystem performs an initialization sequence.
4. The IVA2.2 subsystem asserts the IVA2_RST_DONE signal when initialization completes.
5. The PRM module releases the IVA2_RST2 reset signal.
6. The PRCM.RM_RSTST_IVA2[9] IVA2_SW_RST2 status bit is updated accordingly on release of the IVA2_RST2 reset signal. The MPU software can now program the MMU or download the DSP code.
7. Software clears the PRCM.RM_RSTCTRL_IVA2[0] RST1_IVA2 bit. The PRM module waits for reset manager 1 in the IVA2 power domain to time out.
8. The PRM module releases the IVA2_RST1 reset signal. The DSP boots.
9. The PRCM.RM_RSTST_IVA2[8] IVA2_SW_RST1 status bit is updated accordingly on release of the IVA2_RST1 reset signal.
10. DSP software enables the video sequencer (SEQ) clock.
11. DSP software clears the PRCM.RM_RSTCTRL_IVA2[2] RST3_IVA2 bit. The PRM waits for reset manager 3 in the IVA2 power domain to time out.
12. After reset manager 3 times out, the PRM can release the IVA2_RST3 reset signal. The SEQ boots.
13. The PRCM.RM_RSTST_IVA2[10] IVA2_SW_RST3 bit is updated accordingly on release of the IVA2_RST3 reset signal.

4.5.9.4 IVA2 Software Reset Sequence

This section describes the software reset sequence and timing relationships of the IVA2.2 subsystem.

The assumptions are:

- The MPU is running.
- All sources of reset to the IVA2.2 subsystem are released.
- The software ensures that the IVA2.2 subsystem software sources of reset are not asserted while the IVA2 power domain clocks are running.
- The software clears the previous reset status.

[Figure 4-29](#) shows the IVA2 software reset sequence.

Figure 4-29. IVA2 Software Reset Sequence

prcm-030

The sequence is:

1. DSP software puts the SEQ in idle, and can safely assert the IVA2 power domain software reset.
2. The PRM module asserts the IVA2_RST3 reset asynchronously.

3. The DSP goes to idle, and the CM gates the IVA_CLK clock.
4. MPU software asserts the IVA2.2 subsystem software reset.
5. The PRM asserts all remaining IVA2 power domain warm resets asynchronously.
6. MPU software enables the IVA2 power domain clock. A partial initialization sequence is performed.
7. MPU software clears the PRCM.RM_RSTCTRL_IVA2[1] RST2_IVA2 bit.
8. The IVA2.2 subsystem asserts the IVA2_RST_DONE signal when initialization completes.
9. The PRM module releases the IVA2_RST2 reset signal when reset manager 2 in the IVA2 power domain times out.
10. The PRCM.RM_RSTST_IVA2[9] IVA2_SW_RST2 status bit is updated accordingly on release of the IVA2_RST2 reset signal. MPU software now programs the MMU or downloads the DSP code.
11. Software clears the PRCM.RM_RSTCTRL_IVA2[0] RST1_IVA2 bit. The PRM module waits for reset manager 1 in the IVA2 power domain to time out.
12. After reset manager 1 times out, the PRM module releases the IVA2_RST1 reset signal. The DSP boots.
13. The PRCM.RM_RSTST_IVA2[8] IVA2_SW_RST1 status bit is updated accordingly on release of the IVA2_RST1 reset signal.
14. DSP software enables the SEQ clock.
15. DSP software clears the PRCM.RM_RSTCTRL_IVA2[2] RST3_IVA2 bit. The PRM module waits for reset manager 3 in the IVA2 power domain to time out.
16. The PRM module releases the IVA2_RST3 reset signal. The SEQ boots.
17. The PRCM.RM_RSTST_IVA2[10] IVA2_SW_RST3 status bit is updated accordingly on release of the IVA2_RST3 reset signal.

4.5.9.5 IVA2 Global Warm Reset Sequence

This section describes the reset sequence of the IVA2.2 subsystem and timing relationships on a global warm reset.

The assumptions are:

- The MPU is running.
- All sources of reset to the IVA2.2 subsystem are released.
- Software clears the previous reset status.

[Figure 4-30](#) shows the IVA2 global warm reset sequence.

Figure 4-30. IVA2 Global Warm Reset Sequence

prcm-031

The sequence is:

1. A global warm reset source is asserted (see `sys_nreswarm` in Figure 4-30).

2. The PRM asserts asynchronously all IVA2 power domain warm reset signals (and all other warm reset signals).
3. The PRCM.RM_RSTCTRL_IVA2 register is reset to its default value. As a result, the IVA2 power domain warm reset signals stay asserted on release of the global warm source of reset.
4. DPLL2 is held under its reset configuration; the IVA2 power domain clocks are stopped.
5. The sys_nreswarm global warm source of reset is deasserted.
6. The PRCM.RM_RSTST_IVA2 status register is updated accordingly when the device reset manager times out.
7. The MPU boots and the MPU software sequence, shown in [Section 4.5.9.4](#), from point 6, starts.

4.5.9.6 IVA2 Power Domain Wake-Up Cold Reset Sequence

This section describes the cold reset sequence of the IVA2.2 subsystem when the IVA2 power domain transitions from retention to on power state.

The assumptions are:

- The MPU is running.
- All sources of reset to the IVA2 are released.
- The software ensures that the IVA2 power domain software sources of reset are not asserted while the IVA2 clocks are running.
- The software clears the previous reset status.

[Figure 4-31](#) shows the IVA2 power domain wake-up cold reset sequence.

Figure 4-31. IVA2 Power Domain Power Transition Reset Sequence

prcm-032

The sequence is:

1. DSP software puts the SEQ in inactive state.

2. MPU software programs the IVA2 power domain to go to retention power state during the next sleep transition.
3. The DSP goes to idle mode, and the CM gates the IVA2 clock. The IVA2 power domain enters inactive power state.
4. The IVA2 power domain enters retention power state.
5. The IVA2 power domain is awakened.
6. The PRM asserts the cold reset IVA2_RSTPWRON and all IVA2 warm resets asynchronously.
7. The PRCM.RM_RSTCTRL_IVA2[2] RST3_IVA2 bit is automatically reset to its reset value.
8. The IVA2 power domain is inactive.
9. IVA2 clocks are automatically reenabled. The IVA2 power domain enters active power state.
10. The PRM releases the IVA2_RSTPWRON reset signal when reset manager 2 in the IVA2 power domain times out.
11. On release of IVA2_RSTPWRON, the IVA2 performs an initialization sequence.
12. The PRCM.RM_RSTST_IVA2 register is updated accordingly on release of the IVA2_RSTPWRON reset signal.
13. The IVA2.2 subsystem asserts the IVA2_RSTDONE signal when initialization completes.
14. The PRM module releases the IVA2_RST1 and IVA2_RST2 reset signals. The DSP boots in autonomous mode.
15. DSP software enables the SEQ clock.
16. DSP software clears the PRCM.RM_RSTCTRL_IVA2[2] RST3_IVA2 bit. The PRM module waits for reset manager 3 in the IVA2 power domain to time out.
17. After reset manager 3 times out, the PRM module releases the IVA2_RST3 reset signal. The SEQ boots.
18. The PRCM.RM_RSTST_IVA2[10] IVA2_SW_RST3 bit is updated accordingly on release of the IVA2_RST3 reset signal.

There are two alternate sequences:

- The DSP is held under reset when exiting retention power state. This is done when the MPU software writes 1 to the PRCM.RM_RSTCTRL_IVA2[0] RST1_IVA2 bit. In this case, the MPU software must clear this bit to 0 to reboot the DSP.
- The DSP and MMU are held under reset when exiting retention power state (the MPU software writes 1 to the PRCM.RM_RSTCTRL_IVA2[0] RST1_IVA2 and PRCM.RM_RSTCTRL_IVA2[1] RST2_IVA2 bits). In this case, the MPU software must first clear the PRCM.RM_RSTCTRL_IVA2[1] RST2_IVA2 bit to allow the release of the reset IVA2_RSTPWRON and subsequently (after initialization) the release of IVA2_RST2. Only after the MPU software reprograms the MMU or downloads the DSP code can it clear the PRCM.RM_RSTCTRL_IVA2[0] RST1_IVA2 bit field to boot the DSP.

NOTE:

- Although the IVA2.2 WUGEN module and DPLL2 are part of the IVA2.2 subsystem, they are also part of the CORE power domain and the DPLL2 power domain, respectively. They are reset independently from the IVA2 power domain.
 - The IVA2_RSTPWRON reset is released by software by programming the PRCM.RM_RSTCTRL_IVA2[1] RST2_IVA2 bit. Setting the PRCM.RM_RSTCTRL_IVA2[1] RST2_IVA2 bit does not assert IVA2_RSTPWRON.
 - IVA2_RST3 is asserted when the IVA2 power domain transitions from off or retention state to on state. The corresponding bit in the PRCM.RM_RSTCTRL_IVA2 register is automatically set to 1 during this transition.
 - The release of the IVA2_RST3 reset is stalled as long as the IVA2_RST2 reset is not released.
 - The release of the IVA2_RST2 and IVA2_RST1 resets causes IVA2 to deassert the IVA2_RSTDONE signal.
-

4.6 PRCM Power Manager Functional Description

4.6.1 Overview

4.6.1.1 Introduction

To efficiently manage leakage and reduce dynamic power consumption, the device supports several power-management techniques:

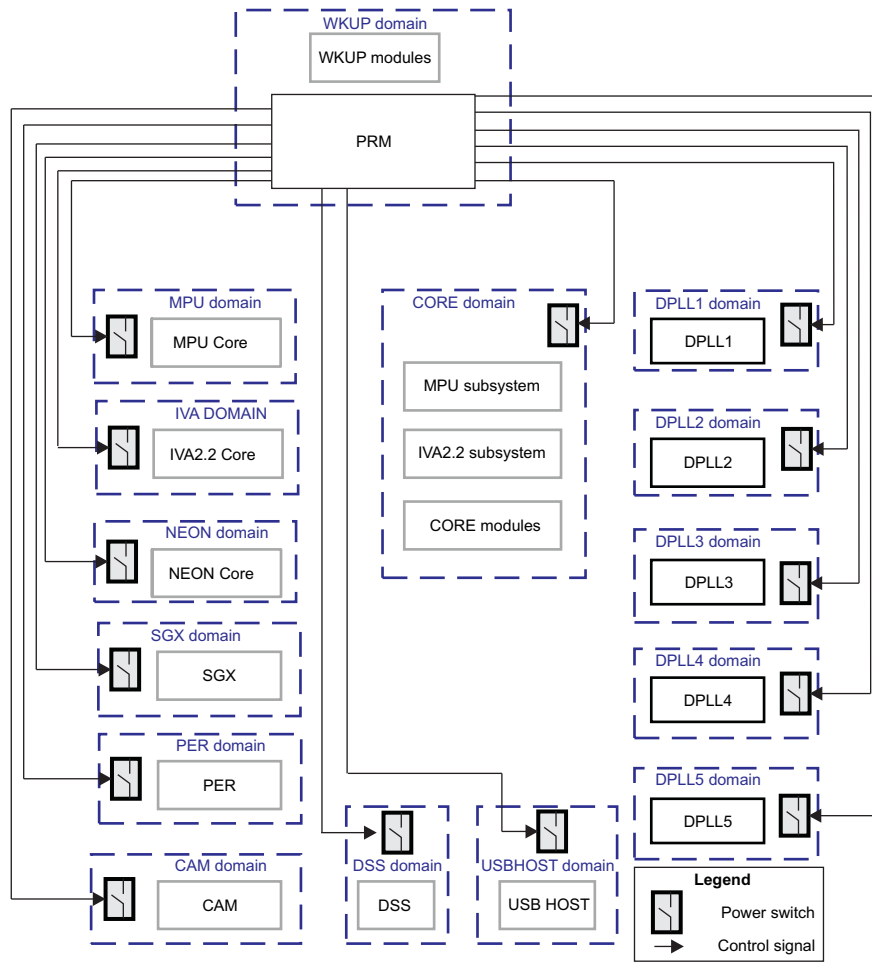

- Dynamic clock-gating conditions
- DVFS
- DPS
- SLM

These power-management techniques require software control and specific hardware features. The hardware features are fully controlled by the PRM part of the PRCM module. These features are:

- Device partitioning into power domains
- Device partitioning into several voltage domains communicating through level shifters
- Logic power-switch control
- RFF control
- Memory power-switch control
- Embedded LDOs (SRAMs, wakeup, emulation) control
- I/O off-mode control
- Level shifter control
- External power IC control

[Figure 4-32](#) is an overview of PRM power management in the device.

Figure 4-32. Power Control Overview

prcm-033

4.6.1.2 Device Partitioning

To substantially reduce leakage in sleep modes (SLM strategy) and to optimize active power-consumption savings (DPS strategy), the device is segmented into power domains:

- MPU: Application processor
- NEON: Multimedia coprocessor
- IVA2: DSP
- SGX: Graphics engine
- CORE: Interconnect, memory controllers, peripherals, and clock management
- DSS: Display subsystem
- CAM: Camera controller
- PER: Low-power use case peripherals
- WKUP: Wakeup (always active)
- USBHOST: USB HOST power domain
- EMU: Emulation
- EFUSE: eFuse farm
- DPLL1: MPU DPLL
- DPLL2: IVA2.2 DPLL
- DPLL3: CORE DPLL
- DPLL4: Peripherals DPLL

- DPLL5: Peripherals DPLL2

Each power domain receives power through an independent switch controlled by the PRM module. In this way, depending on the application scenario, unused power domains can be switched off or put in retention state while others remain active.

Table 4-24 lists the device modules in relation to the power domains.

Table 4-24. Power Domain Modules

Power Domain	Modules
MPU	MPU core ICECrusher CS MPU async bridge (master)
NEON	NEON coprocessor
IVA2	IVA2.2 DSP IVA2 async bridge 1 (master) IVA2 async bridge 2 (slave) Video sequencer (SEQ)

4.6.1.3 Memory and Logic Power Management

Device power domains can have separate control for logic and memory. This depends on the power domain implementation in the device (for details, see [Section 4.6.2, Power Domain Implementation](#)).

Generally, separate switches allow separate management of the logic and memory power states in a power domain.

Memory banks in the MPU (L2 cache), IVA2 (L1, L1 flat, L2, L2 flat), CORE (CORE memory banks 1 to 6), SGX, CAM, DSS, USBHOST, and EMU power domain memories have their own voltage and power control, independent of the logic. However, the user must ensure that memory states are programmed consistently with the logic state.

MPU L1 cache memory does not have an independent control and is supplied with the MPU logic.

CORE memory banks 3,4, 5, and 6 are associated to the domain power state and controlled with the domain logic.

MPU and IVA2 memories are supplied by a common LDO (VDD4). CORE, SGX, CAM, DSS, USBHOST, and EMU memories are supplied by another LDO (VDD5).

4.6.1.4 Power Domain States

Each power domain can be driven by the PRM to four different states, depending on the functional mode required by the user. Power domain states are hardware-defined and depend on the domain clock activity and domain memory/logic switch states.

[Table 4-25](#) defines the power states a power domain can reach in the device.

Table 4-25. Power Domain States

Power State	Power		Clocks
	Logic	Memory	
Active	On	On, retention, or off	On (at least one)
Inactive	On	On, retention, or off	Off (all clocks)

Table 4-25. Power Domain States (continued)

Retention (CSWR)	On	Retention or off	Off (all clocks)
Retention (OSWR)	Off/RFF		
Off	Off	Off	Off (all clocks)

NOTE:

- Closed-switch retention (CSWR): Full domain logic supply is maintained, and supply voltage can be dropped to minimize leakage.
- Open-switch retention (OSWR): Full domain logic is switched off, but the context is saved for modules that embed RFFs.
- Throughout the rest of this chapter, when reference is made only to retention state without explicitly stating whether it is CSWR or OSWR, then the description applies to the two retention states.

In CSWR and OSWR, memories are put in retention or can also be switched off.

4.6.1.5 Power State Transitions

For each power domain, the PRM manages all transitions controlling domain clocks, domain resets, domain logic power switches, memory power switches, and memory retention.

As previously mentioned, a power domain is characterized by different power states: Active, inactive, retention, and off.

A transition is a passage from one state to another.

Two types of power state transitions are possible:

- Sleep: Moving from a higher consumption power state (active) to a lower consumption power state (inactive, retention, or off)
- Wake-up: Moving directly from a lower consumption power state (inactive, retention, or off) to the active power state

For instance, a power domain with initiators and target modules in standby and idle modes operates an active-to-inactive transition. It is then ready to operate an inactive-to-retention or off transition, depending on the requirements.

The device supports eight transitions:

- Active to inactive
- Inactive to active
- Active to retention
- Retention to active
- Active to off
- Off to active

4.6.1.6 Device Power Modes

A device power mode is a specific functional combination of the power states of all the power domains of the device.

Unlike power domain states (see [Section 4.6.1.4](#)), device power modes are not hardware-defined; they are defined by software as relevant combinations of the power domain states.

There are two types of device power modes:

- Active: Any valid combination of power domain states in which one or several domains are still active, regardless of whether any software is running
- Standby: Any valid combination of power domain states in which all the domains are in inactive, retention, or off state

NOTE: All power domain states are hardware-supported, thereby preventing electrical damage to the device. However, software ensures that the power domain states are set correctly, to result in a valid device power mode and ensure correct functioning.

4.6.1.7 Isolation Between Power Domains

When switching a power domain from one state to another, the PRCM module automatically manages domain output isolation to prevent electrical damage.

This mechanism is hardware-supervised and does not require software action.

4.6.2 Power Domain Implementation

4.6.2.1 Device Power Domains

Table 4-26 summarizes the power mode implementation in the device and the control granularity for each power and memory domain.

Table 4-26. Domain Power Control Summary

Functional Domain or Subsystem	Power Domain	PRCM Power Control Type
MPU	MPU	Logic on-off
	NEON	Logic on-off
	CORE	Logic on-off
	EMU	Logic on-off
	L1 cache SRAM	Logic on-off
	L2 cache SRAM	On-off
		BB retention
IVA2.2	IVA2	Logic on-off
		Memory tags retention
	CORE	Logic on-off
		Logic retention
	L1 cache SRAM	On-off
		BB retention
	L1 flat cache SRAM	On-off
		BB retention
	L2 cache SRAM	On-off
		BB retention
	On-off	
	BB retention	
All MPU and IVA2.2 memories		LDO retention
GRAPHICS	SGX	Logic on-off
	Misc SRAM	Logic on-off
DISPLAY	DSS	Logic on-off
	Misc SRAM	Logic on-off
CAMERA	CAM	Logic on-off
	Misc SRAM	Logic on-off

	Misc SRAM	Logic on-off
	CORE	Logic on-off
		Logic retention
	SRAM bank 1	On-off

Table 4-26. Domain Power Control Summary (continued)

Functional Domain or Subsystem	Power Domain	PRCM Power Control Type
CORE (interconnect, memory controllers, peripherals)		BB retention
	SRAM bank 2	On-off
		BB retention
	OSWR SRAM 3	Logic on-off
		BB retention
	CSWR SRAM bank 4	On-off
		BB retention
PERIPHERALS	PER	Logic on-off
		Logic retention
WKUP	WKUP	none
	EMU	Logic on-off
EMULATION	ETB SRAM	On-off
		BB retention
EFUSE	eFuse farm	none
MPU DPLL	DPLL1	Logic on-off
IVA2.2 DPLL	DPLL2	Logic on-off
CORE DPLL	DPLL3	Logic on-off
Peripherals DPLL	DPLL4	Logic on-off
Peripherals DPLL2	DPLL5	Logic on-off

NOTE:

- BB: Back-bias or local memory retention
- OSWR: Open-switch retention
- CSWR: Closed-switch retention
- LDO retention: All memories are in BB mode and the memory array is dropped down.
- Logic on-off: Memory is controlled with the logic (and does not support retention).
- OSWR SRAM bank 3: Corresponds to memories that must be retained when the CORE OSWR mode is activated (the CORE context is maintained only by keeping RFFs alive). These memories are scratchpad, SDMA, and SMS.
- CSWR SRAM bank 4: Corresponds to memories that are retained only in case of CSWR (all logic is maintained with reduced voltage). These memories are USB and MAILBOXES.

The CORE power domain has six memory blocks. Of these six, the power state of only two memory blocks, SRAM bank 1 and SRAM bank 2, can be configured vis-a-vis the domain power state through software setting of the corresponding bit fields in the PRCM.PM_PWSTCTRL_CORE register. The power states of the rest of the memory banks are automatically controlled by the PRCM module (hardware-controlled) and no software setting is possible.

Memory bank 5 of the CORE power domain is used for the USB TLL module save and restore operations. (see [Section 4.8.6](#)). Similarly, the memory bank 6 is for the system control module save and restore feature (see [Chapter 7, System Control Module](#)).

NOTE: Before initiating a domain sleep transition (ON to OFF) on the MPU and CORE power domains, the CORE memory banks must be configured to automatically switch to ON power state when the CORE power domain wakes up (OFF to ON). This is required for correct booting.

This is done by setting the [PM_PWSTCTRL_CORE\[19:18\]](#) MEM2ONSTATE bit field to 0x3 and the [PM_PWSTCTRL_CORE\[17:16\]](#) MEM1ONSTATE bit field to 0x3.

4.6.2.2 Power Domain Memory Status

The PRCM module logs the memory status in the SCM.CONTROL_SEC_STATUS register. The memory status is logged for CORE power domain memory banks 1 and 2 (OCM RAM) and for the L1 and L2 caches of the MPU.

Two statuses are logged for each memory bank:

- Memory is destroyed: The memory array is powered down.
- Memory is not accessible: The memory array is powered down or is in retention.

For information about the SCM, see [Chapter 7, System Control Module](#).

4.6.2.3 Power Domain State Transition Rules

As previously described, a power domain can reach different states. These states are linked to the power applied to the domain and to the domain clock activity.

Any power state transition always depends on and starts with power domain clock activity control. Any active clock in a power domain sets the domain as active (see [Section 4.6.2.1](#)). Therefore, a sleep transition always starts by shutting down the power domain clocks. For more information about power domain clock controls, see [Section 4.7, Clock Manager Functional Description](#).

When all clocks are shut down in a power domain, transitions from inactive-to-off or inactive-to-retention can occur.

Similarly, when a wake-up transition occurs between a lower-power domain state and a higher one, the transition to active state becomes effective when the required clocks are restarted.

[Section 4.8, Idle and Wake-Up Management](#), describes sleep and wake-up transitions.

4.6.2.4 Power Domain Dependencies

Besides the inner conditions to operate a state transition on a single power domain, the device offers hardwired and software-programmable dependencies between the power domains.

Two kinds of dependencies exist:

- Sleep dependencies: Used to start a sleep transition on a power domain only if the related power domains are in mute mode (not requesting any service from the linked power domain)
- Wake-up dependencies: Used to initiate a wake-up transition on a power domain as a consequence of a linked power domain wake-up transition

Two dedicated sets of registers (PRCM.CM_SLEEPDEP_<domain> and PRCM.PM_WKDEP_<domain>) allow the setting of programmable dependencies.

[Section 4.8.5, Sleep and Wake-Up Dependencies](#), summarizes the possible dependency combinations between power domains.

4.6.2.5 Power Domain Controls

4.6.2.5.1 Power Domain Hardware Control

Device power domain implementation depends on hardwired dependencies, both sleep and wake-up transitions, between power domains. This means a single power domain transitions from one power state to another depending on the states and transitions of the linked domains.

For details about the dependencies between power domains, see [Section 4.8, Idle and Wake-Up Management](#), and [Section 4.12, Basic Programming Model](#).

4.6.2.5.2 Power Domain Software Controls

If all conditions are met to initiate a power domain state transition (all the modules are idle/standby and the related clocks are shut down), the PRCM module automatically manages the transition according to the following settings:

- Dependencies setting: The PRCM.CM_SLEEPDEP_<domain> registers and PRCM.PM_WKDEP_<domain> registers are used to set/clear programmable dependencies between power domains.
 Not all dependencies are programmable by software; some are hardwired and thus do not allow any control. For more information about the dependencies between power domains, see [Section 4.8, Idle and Wake-Up Management](#), and [Section 4.12, Basic Programming Model](#).
- Power state transitions setting: The transitions of each power domain state can be controlled by software through a set of dedicated status registers (PRCM.PM_PWSTCTRL_<domain_name>) that allow the configuration of the power state that the domain enters after completing a transition (PRCM.PM_PWSTCTRL_<domain_name>[1:0] POWERSTATE bit field). These status registers are used to check the current state of the logic and memories in a power domain and to learn about any ongoing state transition.
 Also, if the power domain offers different settings for logic and memory, the PRCM.PM_PWSTCTRL_<domain_name> registers allow selection of the state to which the logic and memory go when the power domain is put in retention. They also allow selection of the state to which the memory will go when the power domain is put into on state.
 These features depend on each power domain implementation. For details, see [Section 4.12, Basic Programming Model](#), and [Section 4.14, PRCM Registers Manual](#).
- Event generator: Three registers (PRCM.PM_EVGENCTRL_MPU, PRCM.PM_EVGENONTIM_MPU, and PRCM.PM_EVGENOFFTIM_MPU) let the MPU power domain be switched between on and off (or placed in inactive mode). The PRCM.PM_EVGENONTIM_MPU and PRCM.PM_EVGENOFFTIM_MPU registers set the durations of the on and off modes, respectively.
 For details, see [Section 4.12, Basic Programming Model](#), and [Section 4.14, PRCM Registers Manual](#).

4.7 PRCM Clock Manager Functional Description

This section describes all modules and features in the high-tier device. To check availability of modules and features, see [Section 1.5, OMAP35xx Family](#). To save power, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

NOTE: For a detailed visual representation of the distribution and management of the device clocks, see the device [Clock Tree Tool \(CTT\)](#).

For OMAP35x, use the OMAP3430 Clock Tree Tool.

4.7.1 Overview

The PRCM module provides control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all modules in the device.

The device-level clock generation is handled by an internal oscillator (the system clock oscillator) and DPLLs; clock division and gating are handled by the PRM and the CM sections of the PRCM module. [Figure 4-33](#) shows the high-level clock-management scheme in the device.

A module can use one or more optional functional clocks. Because an optional functional clock is used only for specific features of the module, it can be shut down without stopping the module activity (for example, 54 MHz for the DSS power domain and 96 MHz for the CAM power domain).

4.7.2 External Clock I/Os

Figure 4-34 shows the external clock I/Os of the device.

Figure 4-34. External Clock I/O

4.7.2.1 External Clock Inputs

4.7.2.1.1 32-kHz Always-On Clock

The `sys_32k` input pin supplies the 32-kHz always-on clock (32K_FCLK clock). This clock is used for low-frequency operation (timers, debouncing, etc.). It also supplies the WKUP power domain for operation in the lowest power mode.

4.7.2.1.2 High-Frequency System Clock

The high-frequency system clock (SYS_CLK) is supplied to the device from an external clock source through the `sys_xtalin` input pin or is generated internally by a local system clock crystal oscillator. In the latter case, a crystal is connected between the `sys_xtalout` and `sys_xtalin` device pins. The `sys_boot[6]` pin sets the oscillator operating mode (see Figure 4-12).

The source system clock can be 12, 13, 16.8, 19.2, 26, or 38.4 MHz and can be divided by 2 to provide the standard system clock frequencies (using internal system clock divider configuration in the `PRCM.PRM_CLKSRC_CTRL[7:6]` SYSCLKDIV bit field). It supplies the reference to the DPLLs and is also used by several modules. The system clock is activated in the device after the device power-on reset is released by the reset manager in the PRCM module.

The source-clock selection register (the `PRCM.PRM_CLKSEL [2:0]` SYS_CLKIN_SEL bit field) is set by the software to identify the input frequency of the system clock.

Table 4-27 lists the system clock input configurations.

Table 4-27. System Clock Input Configurations

Input Source	Device Pin Mapping	Description
Quartz	<code>sys_xtalin</code> and <code>sys_xtalout</code>	Internal oscillator is enabled.
Square clock (1.8-V CMOS signal)	<code>sys_xtalin</code> (<code>sys_xtalout</code> is not connected)	Internal oscillator is bypassed.

NOTE: An external pullup or pulldown tied on the sys_boot6 input pin of the device determines whether the internal oscillator is used (oscillator mode) or an external clock source is supplied to the sys_xtalin input pin (bypass mode).

4.7.2.1.3 Alternate Clock

The sys_altclk pin can provide an alternate 54-MHz, 48-MHz, or any other frequency clock.

4.7.2.2 External Clock Outputs

The device can output two clocks externally:

- sys_clkout1 can output an oscillator clock (12, 13, 16.8, 19.2, 26, or 38.4 MHz) at any time. The output oscillator clock can be controlled by software or externally using sys_clkreq control. When the device is in off state, sys_clkreq can be asserted to enable the oscillator and activate sys_clkout1 without waking up the device. The off state polarity of sys_clkout1 is programmable.
- sys_clkout2 can output CM_SYS_CLK (12, 13, 16.8, 19.2, 26, or 38.4 MHz), CORE_CLK (CORE DPLL output), or 96-MHz or 54-MHz clocks. It can be divided by 2, 4, 8, or 16, and its off state polarity is programmable. This output is active only when the CORE power domain is active. Also, the selected source clock must be enabled by software. Enabling sys_clkout2 does not automatically request the required source clock.

4.7.2.3 Summary

Table 4-28 summarizes the external clock I/O.

Table 4-28. External Clock I/Os

Name	I/O ⁽¹⁾	Source/Destination	Description
sys_xtalin	I	Oscillator	Main input clock. Crystal oscillator clock (only at 12, 13, 16.8, or 19.2 MHz) or CMOS digital clock (at 12, 13, 16.8, 19.2, 26, or 38.4 MHz).
sys_xtalout	O	Oscillator	Output of oscillator
sys_clkout1	O	PRCM	Configurable output clock 1
sys_clkout2	O	PRCM	Configurable output clock 2
sys_32k	I	PRCM	32-kHz clock input
sys_altclk	I	PRCM	Alternate selectable clock source for UARTs or NTSC/PAL. It can be 54 MHz, 48 MHz, or any frequency.

⁽¹⁾ I = Input, O = Output

4.7.3 Internal Clock Generation

The device generates internal clocks from following sources:

- PRM
- CM
- DPLLs

Figure 4-35 shows the internal clock-generation scheme of the device.

Figure 4-35. Internal Clock Sources

prcm-076

4.7.3.1 PRM

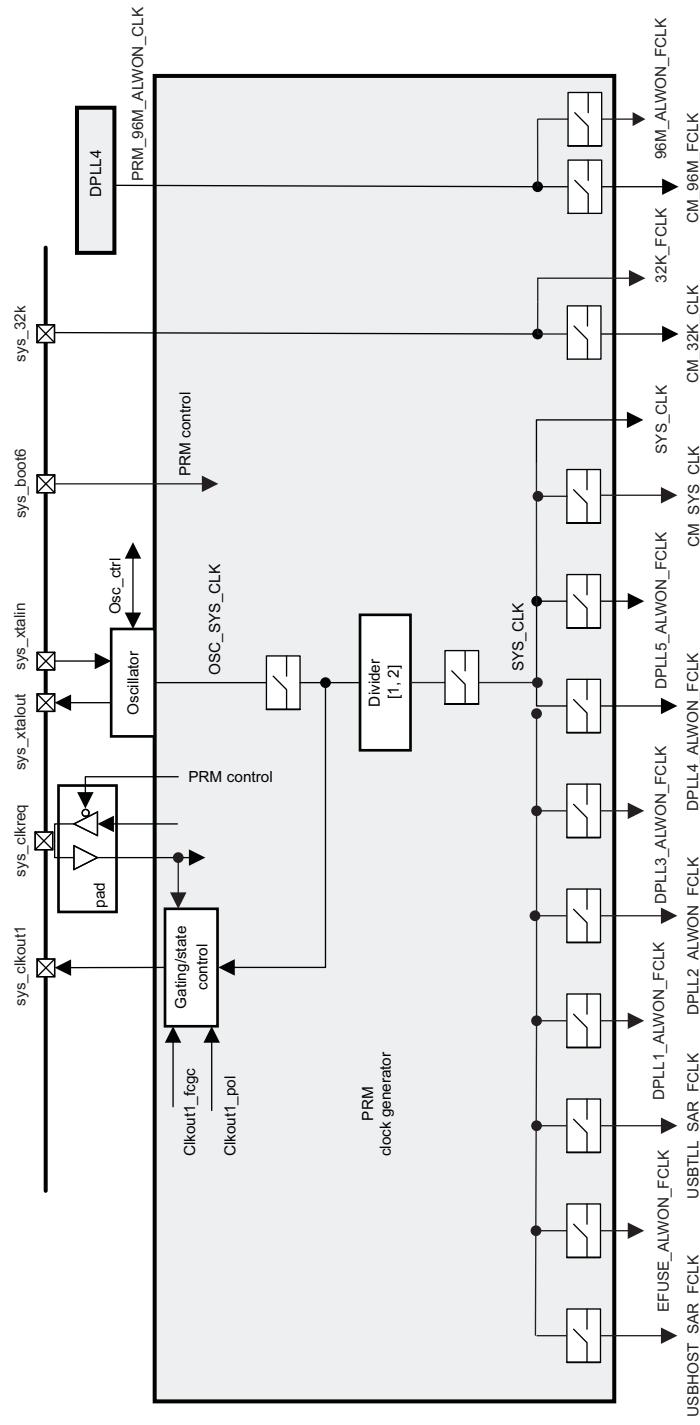

The PRM resides in the WKUP power domain. It handles the generation of the 32-kHz low-frequency clocks and the high-frequency system clocks from the SYS_CLK. It also manages the clock oscillator and the external clock output `sys_clkout1`.

SYS_CLK is generated by the internal oscillator or supplied as the external clock signal on the `sys_xtalin` pin. It supplies most of the clocks in the device. Some of the device clocks sourced by SYS_CLK are always powered (clocks are present even when the CORE power domain is in off state). SYS_CLK is also the source of the WKUP power domain interface clocks.

It also handles the gating and distribution of the 96-MHz clock from DPLL4 to the CM and PER power domain modules.

[Figure 4-36](#) is a functional overview of the PRM. The other clocks in the figure are explained in the following sections.

Figure 4-36. PRCM Clock Generator

prcm-037

4.7.3.2 CM

The CM clock generator generates interface clocks and peripheral functional clocks for most of the modules. It also controls DPLL3, DPLL4, and the external peripheral clock output sys_clkout2 (see [Figure 4-37](#)).

The CM is in the CORE power domain, which can be powered off. When the CORE power domain is powered off, the clocks are not available, and their off state is latched. The DPLL controls are also latched. The RFF architecture ensures that the full CM setting is saved when the CORE power domain goes to retention state, and is transparently restored when it reactivates.

DPLL3 receives SYS_CLK from the PRM module and generates CORE_CLK through the CM. CORE_CLK is the source for the interface clocks (L3 and L4) and the functional clock. The L3 and L4 interface clocks supply the device interconnects and all module interface clocks. The L4 clock is divided for USB (full-speed clock limitation at 50 MHz) and to supply the reset managers (PRM) in the WKUP power domain. The clocks derived from CORE_CLK are fully balanced over the device.

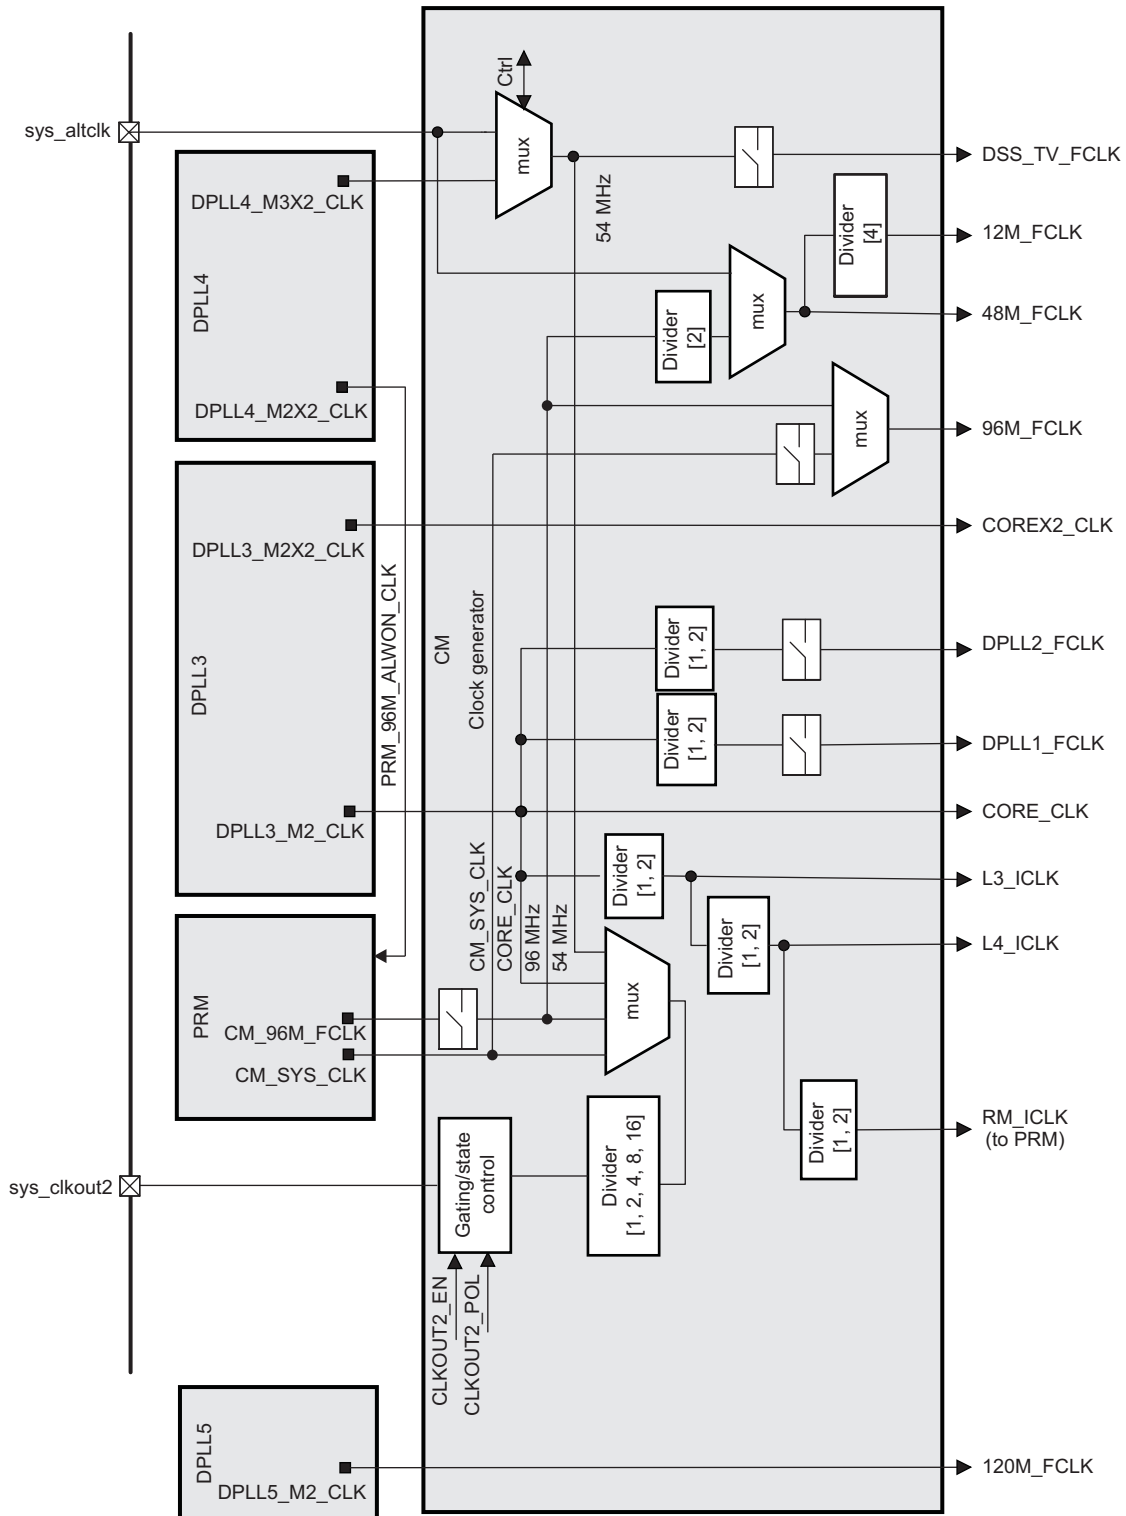

The 96M_FCLK, 48M_FCLK, and 12M_FCLK clocks are functional unbalanced clocks for a number of modules in the CORE and PER power domains.

The functional 96-MHz clock path can be bypassed with SYS_CLK to allow a peripheral such as I²C to function while the DPLL4 is not powered on. The default configuration after initial power on is bypassed with the system clock. Software must switch to the DPLL-generated clock after programming the system settings.

The 96-MHz clock input from the PRM to the CM (CM_96M_FCLK) is internally gated by the CM.

[Figure 4-37](#) is the functional overview of the CM clock generator.

Figure 4-37. CM Clock Generator Functional Overview

prcm-038

4.7.3.3 DPLLs

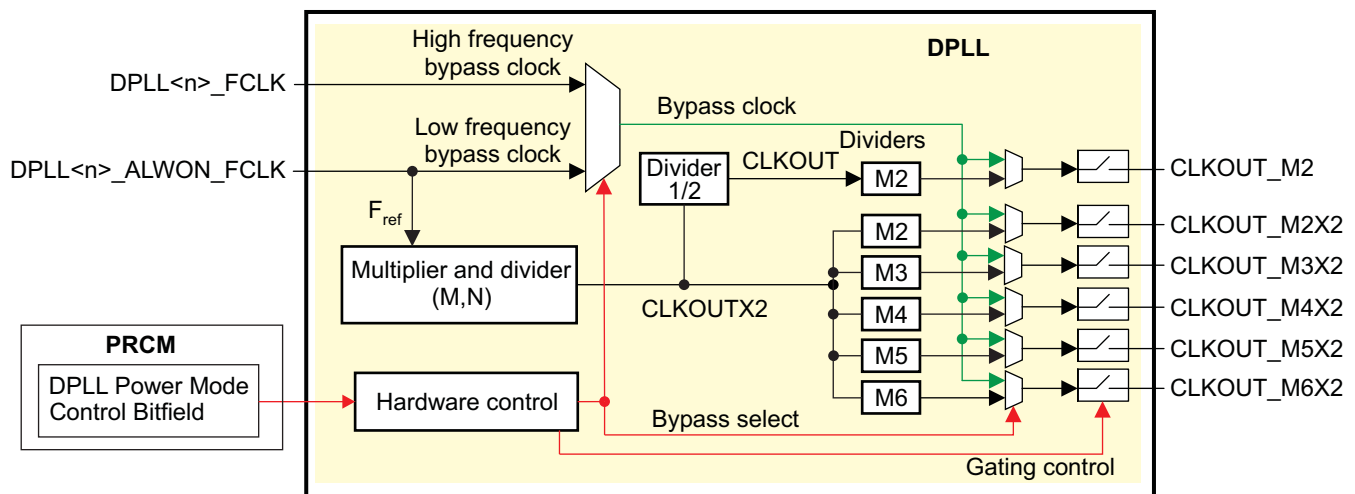

To generate high-frequency clocks, the device supports five on-chip DPLLs controlled directly by the PRCM module:

- DPLL1 (MPU)
- DPLL2 (IVA2)
- DPLL3 (CORE)
- DPLL4 (PER)
- DPLL5 (PER2)

NOTE: This chapter discusses only DPLL1 to DPLL5, because they are directly controlled by the PRCM module. [Chapter 15, Display Subsystem](#), discusses the DPLLs in the display subsystem.

Figure 4-38 shows the functional architecture of a generic DPLL.

Figure 4-38. Generic DPLL Functional Diagram

prcm-039

Depending on its hardware configuration, the DPLL can receive one or two clock inputs.

When the DPLL has two clock inputs, it uses one as the reference clock (F_{ref}) to generate the high-frequency clock; the second one serves as the bypass clock when the DPLL is in bypass mode (not locked and generating the high-frequency clock). For example, DPLL1 and DPLL2 receive the high-frequency bypass clock from the DPLL3 output, and the reference clock from the PRM module.

When the DPLL has only one clock input, it uses that clock input as the reference clock and bypass clock. For example, DPLL3, DPLL4, and DPLL5 receive only one input clock from PRM module, and it is used as the reference and the bypass clock.

It internally generates two main clocks according to the following equations:

- $CLKOUTX2 = (F_{ref} \times 2 \times M)/(N+1)$
- $CLKOUT = CLKOUTX2/2$

where M is an 11-bit multiplier and N is a 7-bit divider.

NOTE: When M is set to 0 or 1, the DPLL is forced to bypass mode.

The internal clocks (CLKOUT and CLKOUTX2) of the DPLL can then be used to generate six independent output clocks:

- $CLKOUT_M2 = CLKOUT/M2$
- $CLKOUT_M2X2 = CLKOUTX2/M2$

- $\text{CLKOUT_M3X2} = \text{CLKOUTX2/M3}$
- $\text{CLKOUT_M4X2} = \text{CLKOUTX2/M4}$
- $\text{CLKOUT_M5X2} = \text{CLKOUTX2/M5}$
- $\text{CLKOUT_M6X2} = \text{CLKOUTX2/M6}$

where M2, M3, M4, M5, and M6 are additional dividers for the DPLL-synthesized clock.

The output clock frequencies defined by these equations are generated by the DPLL only when it is locked. When the DPLL is in bypass mode, however, all clock outputs run at the bypass clock frequency. The bypass clock can be a high-frequency bypass clock (only for DPLL1 and DPLL2) or the low-frequency reference clock.

The DPLL also provides an independent clock-gating signal for each of the six output clocks. The PRCM module provides the DPLL with a clock-gating control signal, and the DPLL returns a clock activity status signal indicating whether the output clock is effectively gated or running.

For an explanation of the DPLL multiplier, divider settings, and gating controls, see [Section 4.7.6, DPLL Control](#).

Each clock-generating DPLL of the device has the following features:

- Independent power domain
- Control by the CM
- Fed by always-on SYS_CLK with independent gating control for the SYS_CLK
- Analog part supplied by a dedicated power supply (VDDPLL and VDDADAC at 1.8 V) and an embedded LDO to eliminate 1-MHz noise
- Up to six independent output dividers for simultaneous generation of multiple output clocks with different frequencies

4.7.3.3.1 DPLL1 (MPU) and DPLL2 (IVA2)

DPLL1 and DPLL2 are in the MPU and IVA2.2 subsystems, respectively. The DPLLs supply the source clocks for their respective subsystems, which use the source clocks to internally generate all subsystem clocks.

DPLL1 and DPLL2 each use a reference clock (DPLL1_ALWON_FCLK and DPLL2_ALWON_FCLK, respectively) to produce their synthesized clocks. They receive these reference clocks from the PRM module, and their high-frequency bypass clocks (DPLL1_FCLK and DPLL2_FCLK, respectively) from the CM. The reference clock is SYS_CLK, and the high-frequency bypass clock is CORE_CLK.

To save on DPLL power consumption by the processors, the high-frequency bypass input clock from DPLL3 (CORE) is used when the DPLLs are set to bypass mode (statically, or dynamically during relock time) or when the processors are not required to run faster than at L3 clock speed. This use of the high-frequency bypass input clock also optimizes the performance of the DPLLs during frequency scaling.

4.7.3.3.2 DPLL3 (CORE)

[Figure 4-39](#) is a block diagram of DPLL3.

Figure 4-39. DPLL3 Clocks

prcm-040

DPLL3 receives its reference clock (DPLL3_ALWON_FCLK), which is the SYS_CLK, from the PRM. DPLL3 does not receive a high-frequency bypass clock, and it uses the reference clock as the low-frequency bypass clock. DPLL3 supplies the source clock for all interfaces and a few functional clocks for the device modules. It is also the source of the emulation trace clock. While the CORE power domain is on, the output of DPLL3 can be used as HS bypass clock input to DPLL1 and DPLL2.

4.7.3.3.3 DPLL4 (Peripherals)

Figure 4-40 is a block diagram of DPLL4.

Figure 4-40. DPLL4 Clocks

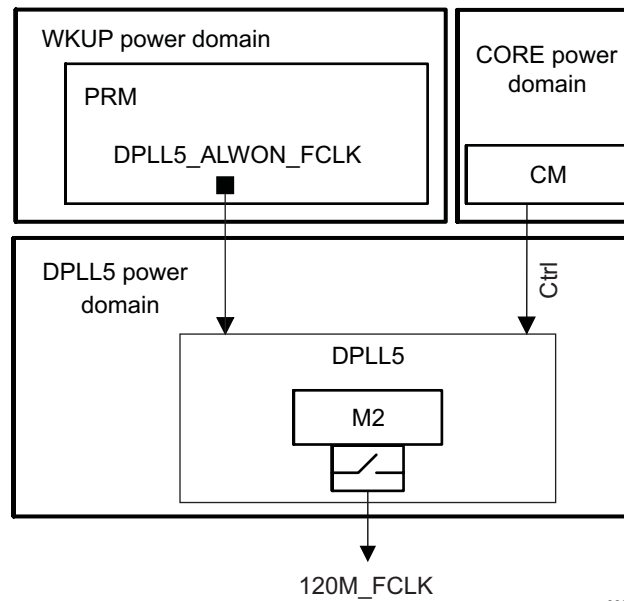

DPLL4 receives its reference clock (DPLL4_ALWON_FCLK), which is the SYS_CLK, from the PRM. DPLL4 does not receive a high-frequency bypass clock, and it uses the reference clock as the low-frequency bypass clock. DPLL4 generates clocks for the peripherals, supplying five clock sources:

- 96-MHz always-on source clock for the PRM
- 54-MHz to TV DAC
- Display functional clock
- Camera sensor clock
- Emulation trace clock

The clock outputs to the DSS, PER, and EMU power domains are always on.

4.7.3.3.4 DPLL5 (Peripherals)

Figure 4-41 is a block diagram of DPLL5.

Figure 4-41. DPLL5 Clocks

prcm-089

DPLL5 receives its reference clock (DPLL5_ALWON_FCLK), which is the SYS_CLK, from the PRM. DPLL5 does not receive a high-frequency bypass clock, and it uses the reference clock as the low-frequency bypass clock. DPLL5 generates clocks for the peripherals, supplying five clock sources:

- 120-MHz functional clock to the peripheral domain modules

4.7.3.3.5 DPLL Clock Summary

Table 4-29 summarizes the use of the divided output clocks of the five DPLLs in the device.

Table 4-29. DPLL Output Clocks

	CLKOUT_M2	CLKOUT_M2X2	CLKOUT_M3X2	CLKOUT_M4X2	CLKOUT_M5X2	CLKOUT_M6X2
DPLL1		X ⁽¹⁾				
DPLL2	X					
DPLL3	X	X	X			
DPLL4		X	X	X	X	X
DPLL5	X					

⁽¹⁾ X represents the DPLL clock output used.

4.7.3.4 Summary

Table 4-30 summarizes the source clocks in the device.

Table 4-30. Source-Clock Summary

Clock	External/Internal Source	Clock Generator	Description
32K_FCLK	sys_32k (input pin)	PRM	
SYS_CLK	Oscillator	PRM	System clock. Serves as primary source clock of the device. Also used as functional and interface clock for PRM.
DSS_TV_CLK	DPLL4/sys_altclk (input pin)	CM	DSS TV clock
120M_FCLK	DPLL5	CM	
96M_FCLK	DPLL4	CM	
48M_FCLK	DPLL4/sys_altclk (input pin)	CM	
12M_FCLK	DPLL4/sys_altclk (input pin)	CM	
96M_ALWON_CLK		DPLL4	Direct from DPLL4
CORE_CLK	DPLL3	CM	DPLL3 clock output frequency
COREX2_CLK	DPLL3	CM	DPLL3 clock output frequency x 2
L3_ICLK	DPLL3	CM	L3 interconnect interface clock
L4_ICLK	DPLL3	CM	L4 interconnect interface clock
MPU_CLK		DPLL1	MPU subsystem source clock
IVA2_CLK		DPLL2	IVA2.2 subsystem source clock

4.7.4 Clock Distribution

4.7.4.1 Power Domain Clock Distribution

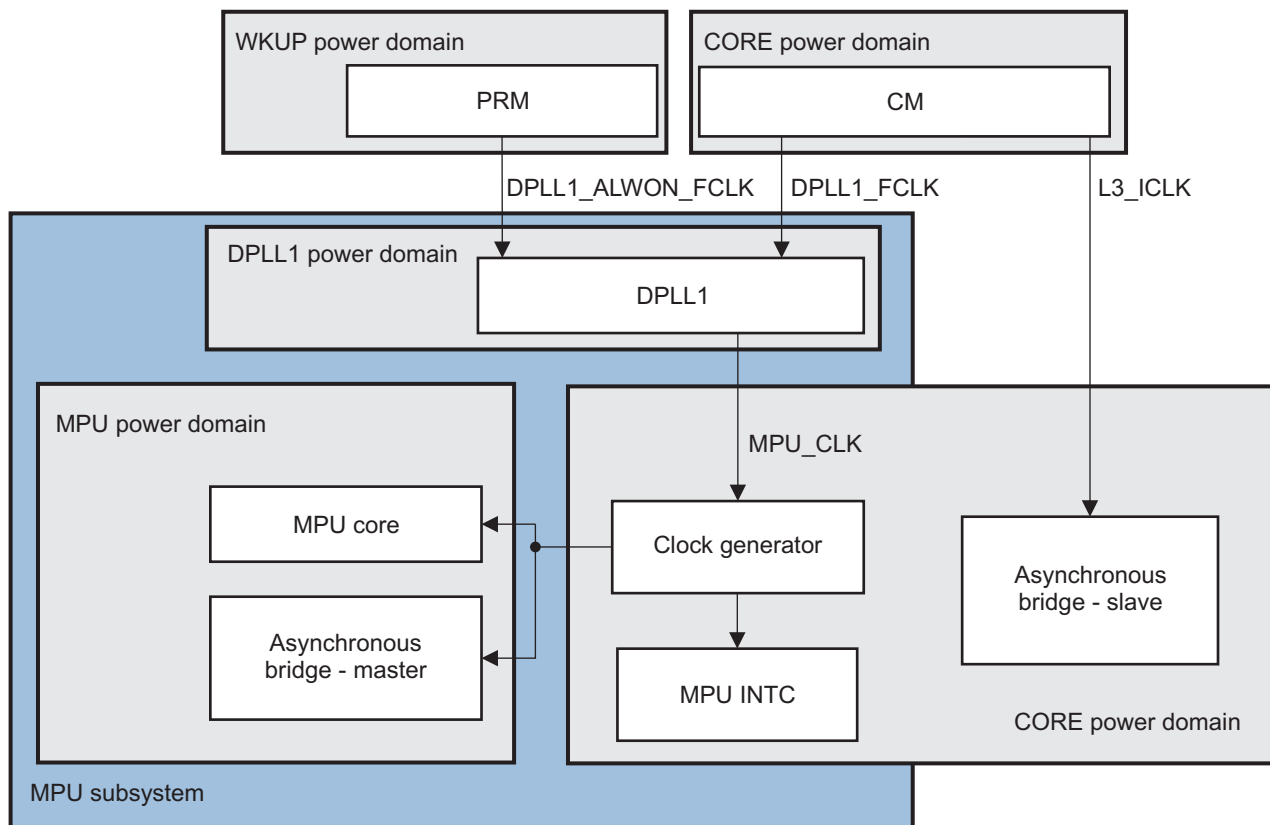

This section describes the PRCM clock distribution over device power domains.

4.7.4.1.1 MPU Power Domain

The PRCM module does not directly provide any clock to the MPU power domain. It feeds only DPLL1, which generates MPU_CLK. All clocks are then locally generated by the clock generator in the MPU subsystem.

Figure 4-42 shows the clocking scheme in the MPU power domain.

Figure 4-42. MPU Power Domain Clocking Scheme

prcm-042

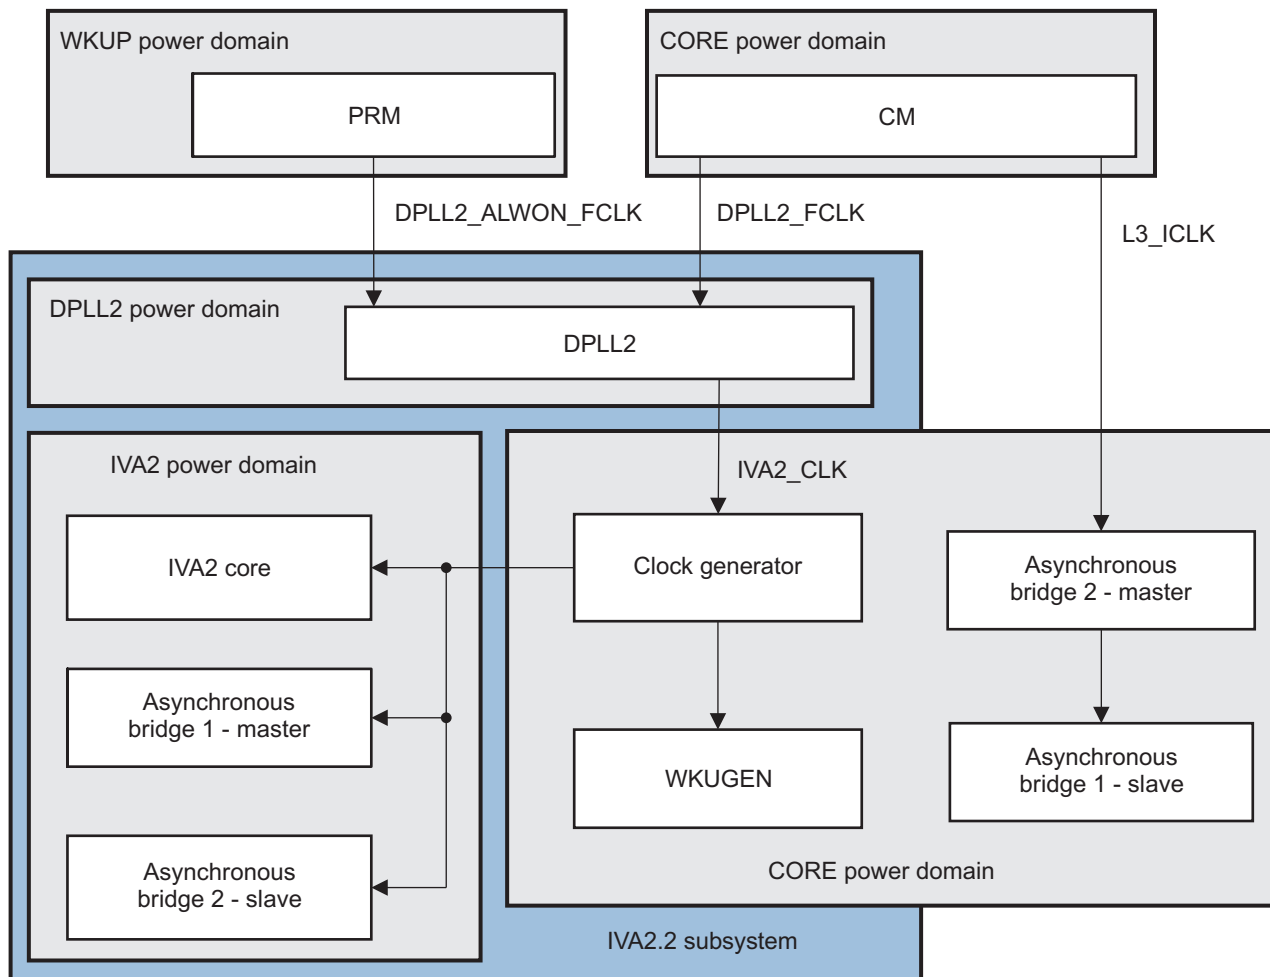

NOTE: The MPU_CLK is divided by 2 in the MPU subsystem to generate ARM_FCLK. This divider is active only when the DPLL is locked. (For information about ARM_FCLK, see [Chapter 3, MPU Subsystem](#)).

4.7.4.1.2 IVA2 Power Domain

The PRCM module does not directly provide any clock to the IVA2 power domain. It feeds only DPLL2, which generates IVA2_CLK. All clocks are then locally generated by a clock generator in the IVA2.2 subsystem.

Figure 4-43 shows the clocking scheme in the IVA2 power domain.

Figure 4-43. IVA2 Power Domain Clocking Scheme

prcm-043

4.7.4.1.3 SGX Power Domain

This section describes all modules and features in the high-tier device. To check availability of modules and features, see [Section 1.5, OMAP35xx Family](#). To save power, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

The SGX subsystem interface clock is sourced by the L3 clock. The functional clock source can be selected between CORE_CLK and CM_96M_FCLK. When the functional clock source is CORE_CLK, its frequency can be divided (by 3, 4, or 6).

[Figure 4-44](#) shows the clocking scheme in the SGX power domain.

Figure 4-44. SGX Power Domain Clocking Scheme

4.7.4.1.4 CORE Power Domain

The CORE power domain has L3- and L4-derived clock domains.

The CORE power domain receives several functional clocks (12-, 48-, 96-MHz, system, and 32-kHz) that feed its peripherals and modules, with following exception:

- The McBSP 1 and McBSP 5 modules can be clocked by CORE_96M_FCLK from the CM or from an external clock, MCBSP_CLKS. The SCM manages the selection between the two sources. For more information about the SCM, see [Chapter 7, System Control Module](#).

[Figure 4-45](#) through [Figure 4-47](#) show the clock signals and their relationships in the CORE power domain.

Figure 4-45. CORE Clock Signals: Part 1

prcm-045

Figure 4-46. CORE Clock Signals: Part 2

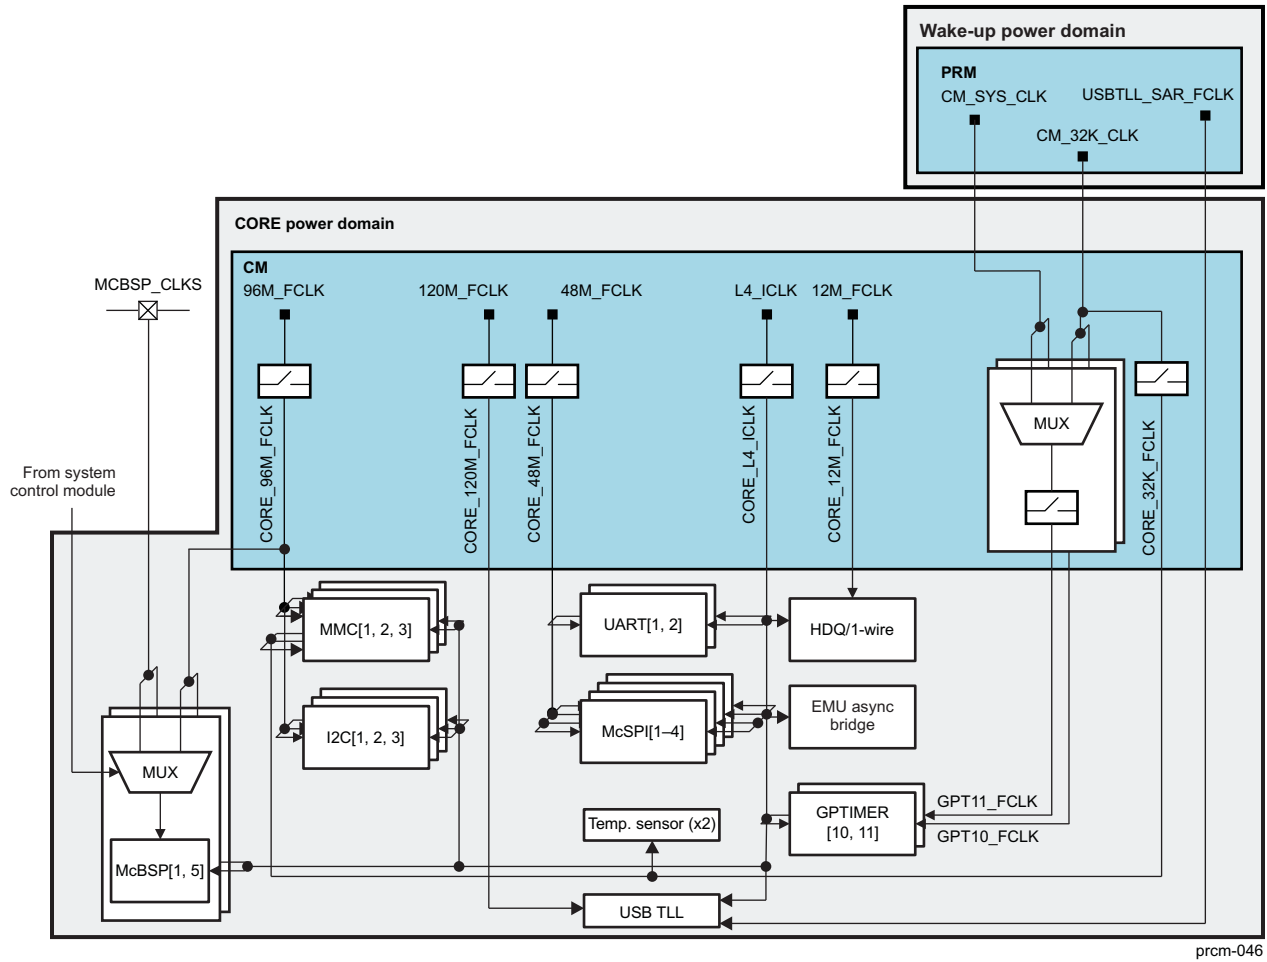

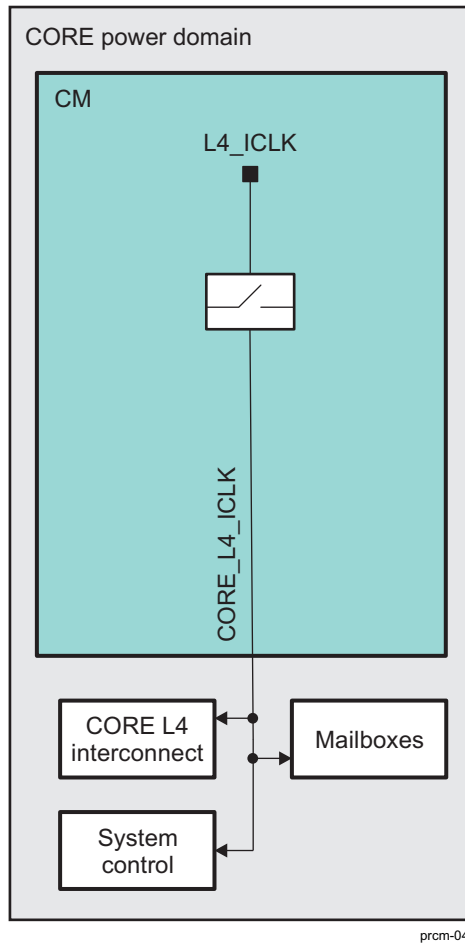

Figure 4-47. CORE Clock Signals: Part 3

4.7.4.1.5 EFUSE Power Domain

Figure 4-48 shows the clock signals and their relationships in the EFUSE power domain.

Figure 4-48. EFUSE Clock Signals

prcm-048

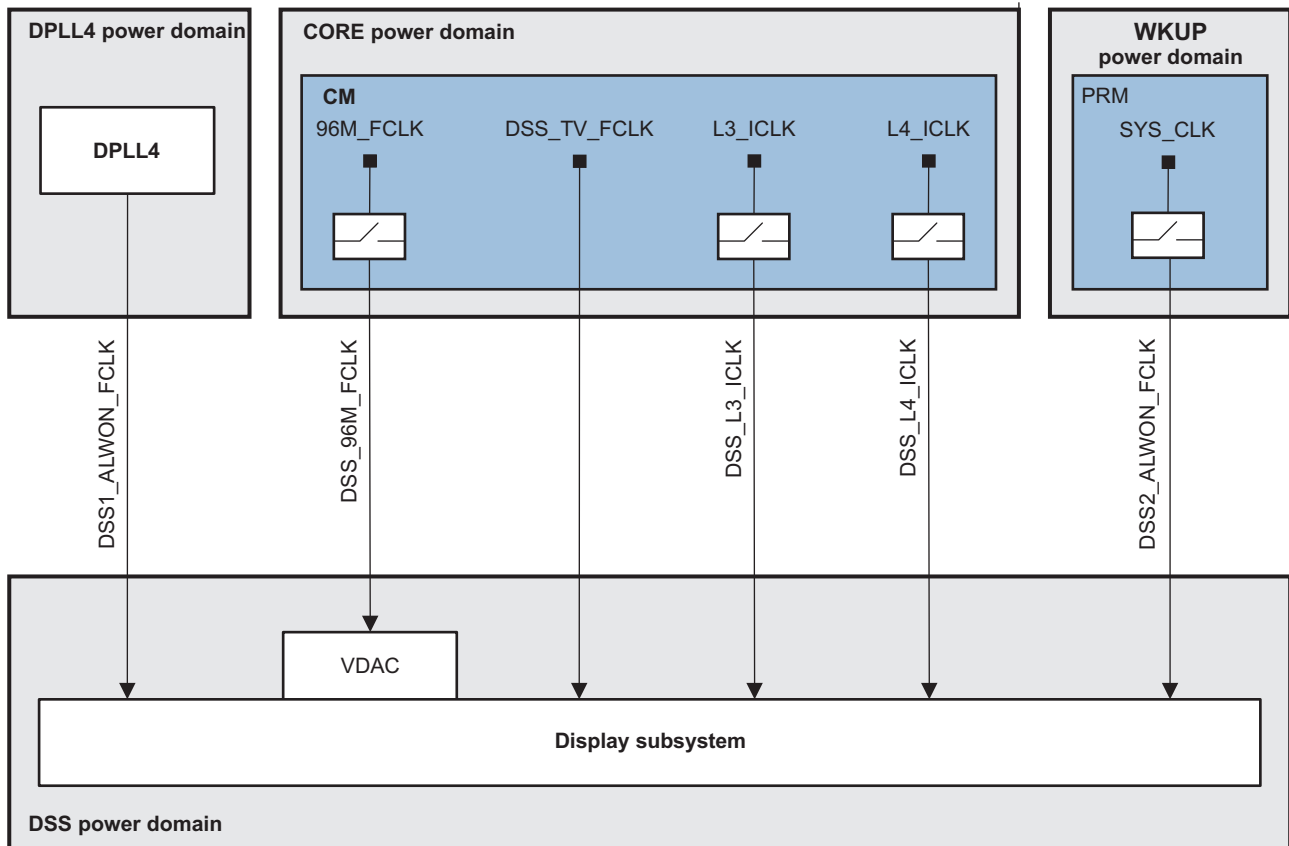

The EFUSE power domain lets the eFuse configuration be saved even when the CORE power domain is off. The EFUSE sense procedure is performed at device power up and on device wakeup from off mode. During this procedure, the PRM enables the EFUSE_ALWON_FCLK clock.

4.7.4.1.6 DSS Power Domain

This section describes all modules and features in the high-tier device. To check availability of modules and features, see [Section 1.5, OMAP35xx Family](#). To save power, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

[Figure 4-49](#) shows the clock signals and their relationships in the DSS power domain.

Figure 4-49. DSS Clock Signals

prcm-049

The DSS subsystem interface is clocked with the L3 and L4 clocks. It receives four functional clocks:

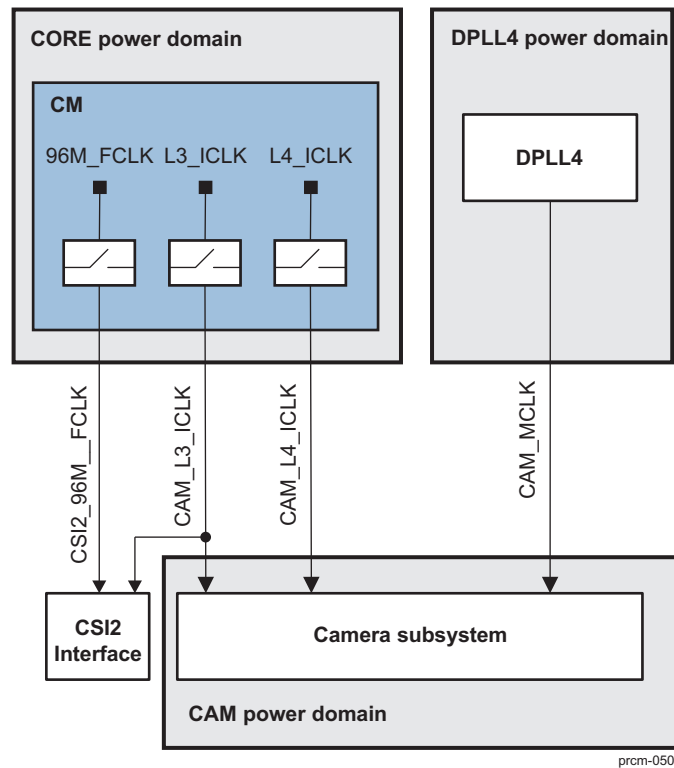

- DSS1_ALWON_FCLK: Issued from DPLL4. Its frequency can be a division by 1 to 16 of the frequency of the DPLL4 synthesized clock.
- DSS2_ALWON_FCLK: The gated SYS_CLK. Used mainly for display in low-power refresh modes.
- DSS_96M_FCLK: Required when TV output is activated
- DSS_TV_FCLK: Required when TV output is activated

4.7.4.1.7 CAM Power Domain

This section describes all modules and features in the high-tier device. To check availability of modules and features, see [Section 1.5, OMAP35xx Family](#). To save power, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

[Figure 4-50](#) shows the clock signals and their relationships in the CAM power domain.

Figure 4-50. CAM Clock Signals

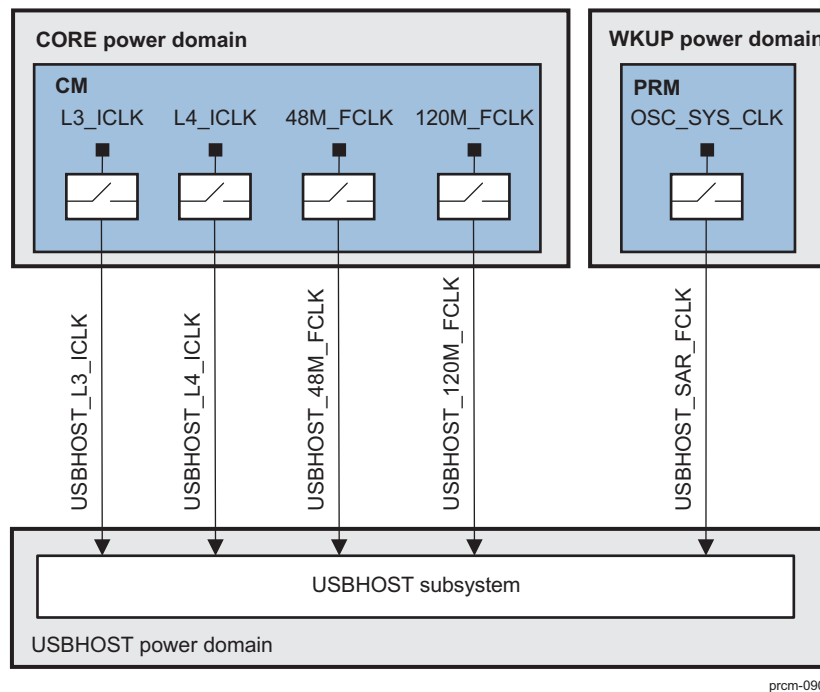

The camera subsystem interface is clocked with the L3 and L4 clocks (CAM_L3_ICLK and CAM_L4_ICLK, respectively). CAM_L3_ICLK is also used as the main functional clock. The functional clock (CAM_MCLK) is provided by DPLL4 to supply the external sensor.

4.7.4.1.8 USBHOST Power Domain

Figure 4-51 shows the clock signals and their relationships in the USBHOST power domain.

Figure 4-51. USBHOST Clock Signals

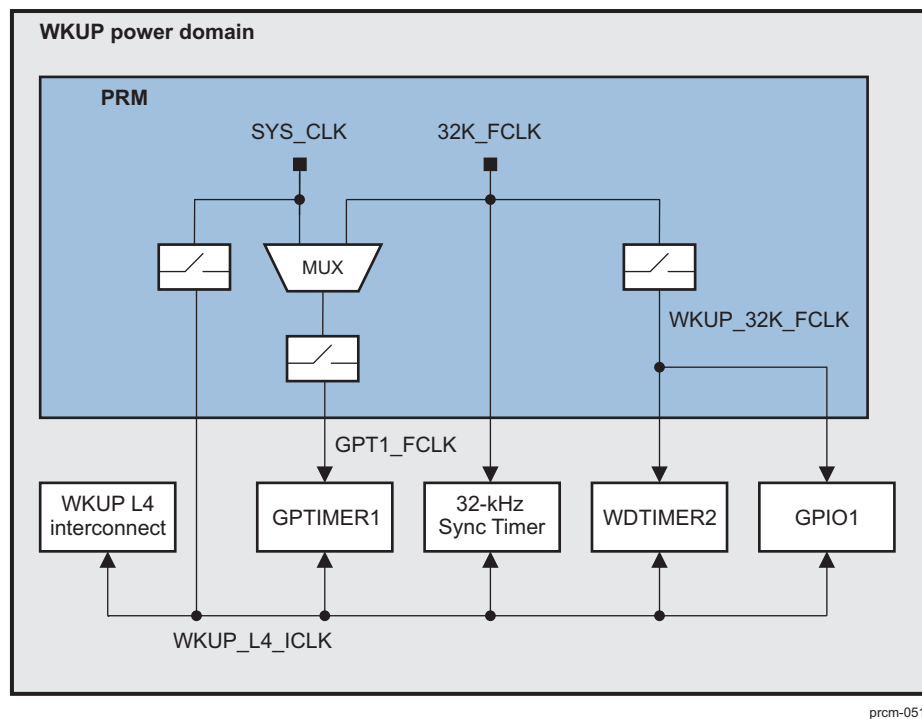

The HS USB host subsystem interface is clocked with the L3 and L4 clocks (USBHOST_L3_ICLK and USBHOST_L4_ICLK, respectively).

The HS USB host subsystem requires two functional clocks (USBHOST_120M_FCLK and USBHOST_48M_FCLK) that may or may not be requested simultaneously. Therefore, they are gated independently based on the configuration of the [CM_FCLKEN_USBHOST\[0\]](#) EN_USBHOST1 and [CM_FCLKEN_USBHOST\[1\]](#) EN_USBHOST2 bits.

The HS USB host subsystem gets an additional functional clock from the PRM (USBHOST_SAR_FCLK). It is dedicated to the save-and-restore mechanism and is automatically gated/enabled by the PRM, based on the HS USB host save-and-restore bit configuration (the [PM_PWSTCTRL_USBHOST\[4\]](#) SAVEANDRESTORE bit) and on the USBHOST power domain state transitions.

4.7.4.1.9 WKUP Power Domain

Figure 4-52 shows the clock signals and their relationships in the WKUP power domain.

Figure 4-52. WKUP Clock Signals

All clocks in the WKUP power domain are generated by the PRM. The functional clock GPT1_FCLK of GPTIMER1 can be selected as SYS_CLK or 32K_FCLK. The 32-kHz sync timer, WDTIMER2, and GPIO1 receive 32K_FCLK as their functional clock. This is the low-frequency always-on clock.

The voltage controller module in the PRM receives SYS_CLK as its functional clock. The dedicated I2C4 module implemented in the voltage controller uses the same functional clock (SYS_CLK).

The PRM receives SYS_CLK as the L4 interface clock. For all other modules of the WKUP power domain, the L4 interface clock WKUP_L4_ICLK is derived from SYS_CLK. Communication between the WKUP power domain and CORE L4 interconnects is asynchronous.

4.7.4.1.10 PER Power Domain

Figure 4-53 shows the clock signals and their relationships in the PER power domain.

Figure 4-53. PER Clock Signals

prcm-052

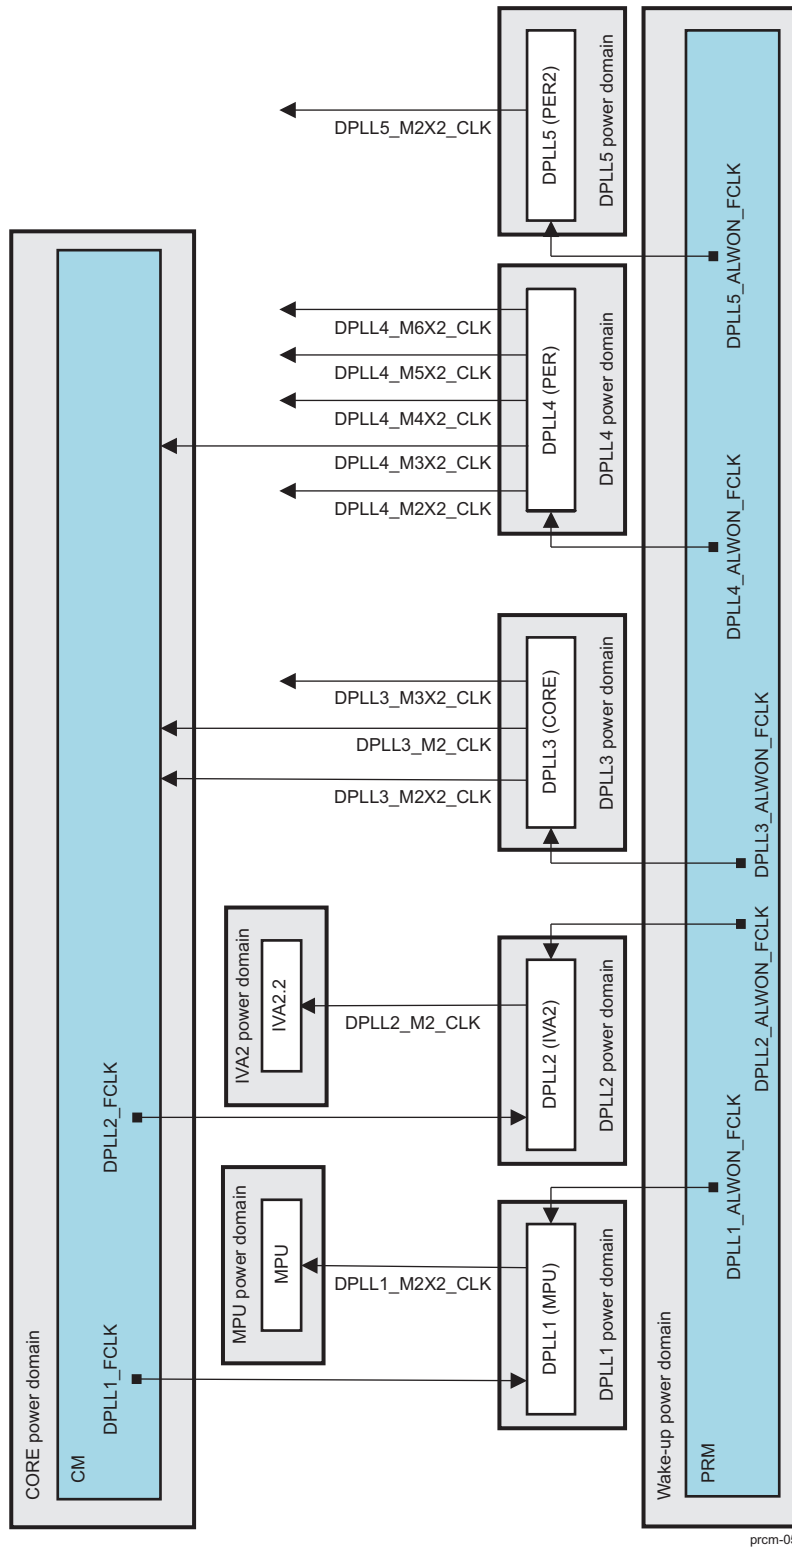

The PER power domain receives several functional clocks (48M_FCLK, 96M_ALWON_FCLK, SYS_CLK, and 32K_FCLK) that feed its peripherals and modules. All the functional clocks (except 48M_FCLK) are permanently supplied so that the peripherals can be used during low-power scenarios, even when the CORE power domain is off. Figure 4-53 shows the clock distribution scheme in the PER power domain.

The McBSP 2, 3, and 4 modules can be clocked by a clock from PRM (PER_96M_FCLK) or from an external clock (MCBSP_CLKS). This clock must be permanently buffered from the pad to the PER power domain. The device SCM manages the selection between the two (see Chapter 7, System Control Module).

4.7.4.1.11 DPLL Domains

The PRCM module provides clock sources for the five DPLLs, as shown in Figure 4-54.

Figure 4-54. DPLL Clock Signals

prcm-054

The PRCM module also manages clock-gating control for these DPLL outputs.

The MPU and IVA2 processors use clock outputs locally in their respective subsystems. The CM uses the DPLL3 clock outputs to generate all interface clocks and some functional clocks. The CM uses two of the five clocks generated by DPLL4 and one clock output of DPLL5 to generate functional clocks for the peripheral domain modules. The remaining three clocks of DPLL4 are propagated to their corresponding modules.

4.7.4.2 Clock Distribution Summary

4.7.4.2.1 Power Domain Source Clocks

Table 4-31 summarizes clock distribution for each power domain. The clock type indicates whether a clock is supplied when the CM (CORE power domain) is off. "Normal" means that the clock is gated when the power domain is off, while the always-on clock remains active even when the CORE power domain is off.

Table 4-31. Clock Distribution

Power Domain	Clock	Generator	Type	Destination
MPU	MPU_CLK	DPLL1	Normal	MPU subsystem
NEON				NEON
IVA2	IVA2_CLK	DPLL2	Normal	IVA2.2 subsystem
SGX	SGX_FCLK	CM	Normal	SGX subsystem
	SGX_L3_ICLK	CM	Normal	
CORE	CORE_120M_FCLK	CM	Normal	USB TLL
	CORE_96M_FCLK	CM	Normal	McBSP[1,5], MMC[1,2,3], I2C[1,2,3]
	CORE_48M_FCLK	CM	Normal	UART[1,2], McSPI[1..4]
	CORE_12M_FCLK	CM	Normal	HDQ
	GPT10_FCLK	CM	Normal	GPTIMER10
	GPT11_FCLK	CM	Normal	GPTIMER11
	USBTLL_SAR_FCLK	PRM	Normal	USB TLL
	CM_32K_CLK	PRM	Normal	Temperature sensor (x2), MMC[1,2,3]
	CORE_L3_ICLK	CM	Normal	L3 interconnect, SDMA, MPU async bridge (slave), IVA2 async bridge 1 (slave), IVA2 async bridge 2 (master), HS USB, SMS, GPMC, OCM ROM, SDRC, OCM RAM, CORE L3 interconnect
CORE_L4_ICLK	CM	Normal	L3 interconnect, SDMA, HS USB, ICR, McBSP[1,5], MMC[1,2], I2C[1..3], GPTIMER [10,11], UART[1,2], McSPI[1..4], HDQ, CORE L4 interconnect, MAILBOXES, SCM	
DSS	DSS_TV_FCLK	CM	Normal	DSS, VDAC
	DSS_96M_FCLK	CM	Normal	VDAC
	DSS1_ALWON_FCLK	DPLL4	Always-on	DSS
	DSS2_ALWON_FCLK	PRM	Always-on	
	DSS_L3_ICLK	CM	Normal	
DSS_L4_ICLK	CM	Normal		
CAM	CAM_MCLK	DPLL4	Normal	Camera subsystem
	CAM_L3_ICLK	CM	Normal	Camera subsystem, CSI2 interface
	CAM_L4_ICLK	CM	Normal	Camera subsystem
	CSI2_96M_FCLK	CM	Normal	CSI2 interface
PER	96M_ALWON_FCLK	PRM	Always-on	McBSP[2..4]
	PER_48M_FCLK	CM	Normal	UART3
	PER_32K_ALWON_FCLK	CM	Always-on	WDTIMER3, GPIO[2..6],

Table 4-31. Clock Distribution (continued)

Power Domain	Clock	Generator	Type	Destination
	GPT2_ALWON_FCLK	PRM	Always-on	GPTIMER2
	GPT3_ALWON_FCLK	PRM	Always-on	GPTIMER3
	GPT4_ALWON_FCLK	PRM	Always-on	GPTIMER4
	GPT5_ALWON_FCLK	PRM	Always-on	GPTIMER5
	GPT6_ALWON_FCLK	PRM	Always-on	GPTIMER6
	GPT7_ALWON_FCLK	PRM	Always-on	GPTIMER7
	GPT8_ALWON_FCLK	PRM	Always-on	GPTIMER8
	GPT9_ALWON_FCLK	PRM	Always-on	GPTIMER9
	PER_L4_ICLK	CM	Normal	UART3, PER L4 interconnect, WDTIMER3, GPIO[2..6], GPTIMER[2..9], McBSP[2..4]
WKUP	WKUP_32K_FCLK	PRM	Always-on	WDTIMER2, GPIO1
	32K_FCLK	PRM	Always-on	32-kHz sync timer
	GPT1_FCLK	PRM	Always-on	GPTIMER1
	WKUP_L4_ICLK	PRM	Normal	WKUP L4 interconnect, GPTIMER1, 32-kHz sync timer, GPIO1, WDTIMER2
EFUSE	EFUSE_ALWON_FCLK	PRM	Always-on	eFuse farm
DPLL1	DPLL1_ALWON_FCLK	PRM	Always-on	DPLL1
	DPLL1_FCLK	CM	Normal	
DPLL2	DPLL2_ALWON_FCLK	PRM	Always-on	DPLL2
	DPLL2_FCLK	CM	Normal	
DPLL3	DPLL3_ALWON_FCLK	PRM	Always-on	DPLL3
DPLL4	DPLL4_ALWON_FCLK	PRM	Always-on	DPLL4
DPLL5	DPLL5_ALWON_FCLK	PRM	Always-on	DPLL5

NOTE:

- Modules supplied by the L3 interface clock only:
 - MPU asynchronous bridge
 - IVA2.2 asynchronous bridges
 - All memory controllers (OCM ROM, OCM RAM, SDRC, SMS, and GPMC)
- Modules that require L3 and L4 clocks:
 - SDMA
 - HS USB
- Modules fed by the L4 clock:
 - SCM
 - Mailboxes
 - ICR
 - Modem INTC
 - All peripherals (McBSP1, McBSP5, MMC1, MMC2, , I2C1, I2C2, I2C3, McSPI1, McSPI2, McSPI3, McSPI4, UART1, UART2, HDQ, GPTIMER10, and GPTIMER11)

4.7.4.2.2 Peripheral Module Clocks

Table 4-32 lists the peripherals, DSS, and CAM functional clock frequency requirements. These frequencies must be operational over the full VDD2 voltage range.

Table 4-32. Peripheral Module Functional Clock Frequencies

Module	Functional Clock	Frequency
MMC-SDIO[1,2,3]	96M_FCLK	96 MHz
McBSP[1, 5]	96M_FCLK	96 MHz
CAM	CAM_MCLK	Up to 216 MHz
McSPI[1..4]	CORE_48M_FCLK	48 MHz
UART[1..3]		
Display subsystem	DSS1_ALWON_FCLK	Up to 173 MHz at nominal voltage (OPP3), and up to 96 MHz at low voltage (OPP2)
	DSS2_ALWON_FCLK	System clock
	DSS_96M_FCLK	96 MHz
	DSS_TV_FCLK	54 MHz
I2C[1..3]	CORE_96M_FCLK	96 MHz
HDQ	CORE_12M_FCLK	12 MHz
GPTIMER1	GPT1_FCLK	32-kHz (p) or system clock
GPTIMER[2..9]	GPTn_ALWON_FCLK	32-kHz (p) or system clock
GPTIMER[10, 11]	GPTn_FCLK	32-kHz or system clock
ICR		
WDTIMER2	WKUP_32K_FCLK	32 kHz
WDTIMER3	PER_32K_ALWON_FCLK	32 kHz
GPIO1	WKUP_32K_FCLK	32 kHz
GPIO[2-6]	PER_32K_ALWON_FCLK	32 kHz
32-kHz sync timer	32K_FCLK	32 kHz (p)
Bandgap/temp sensor	32K_FCLK	32 kHz (p)
System control	CORE_L4_ICLK	L4_ICLK

4.7.5 External Clock Controls

Because the use of `sys_32k` and `sys_altclk` is described in [Section 4.7.3.1, PRM](#), and [Section 4.7.3.2, CM](#), these clock signals are not discussed here. This section discusses the remaining external clock signals.

4.7.5.1 Clock Request (`sys_clkreq`) Control

The system clock request signal `sys_clkreq` is bidirectional.

In bypass mode in the system clock oscillator (see [Section 4.7.5.2](#)), it is an output signal driven by the device to request an external clock. In this case, the output buffer is driven as long as the system clock is requested by the device; otherwise, it remains in high impedance. In this way, other external peripherals can share the same clock request signal with the device.

If the `PRM_POLCTRL[1] CLKREQ_POL` bit = 1, the software must configure the SCM to select the internal pulldown on the `sys_clkreq` pad, or an external pulldown is connected to the pad.

If the `PRM_POLCTRL[1] CLKREQ_POL` bit = 0, the internal pullup on the `sys_clkreq` pad, or an external pull-up, is connected to the pad.

In master mode in the system clock oscillator (see [Section 4.7.5.2](#)), `sys_clkreq` is an input.

If the `PRM_POLCTRL[1] CLKREQ_POL` bit = 1, the software must configure the SCM to select the internal pulldown on the `sys_clkreq` pad, or an external pulldown is connected to the pad.

If the `PRM_POLCTRL[1] CLKREQ_POL` bit = 0, the internal pullup on the `sys_clkreq` pad, or an external pullup, is connected to the pad.

The `PRM_POLCTRL[1] CLKREQ_POL` bit allows software control over the polarity of `sys_clkreq`. This software setting takes effect when the clock is requested by the device, and also when the clock request is driven externally. The output buffer is driven directly by this register when the clock request comes from OMAP.

Table 4-33 describes the bidirectional control of the sys_clkreq pad.

Table 4-33. sys_clkreq Pad Direction Control

Oscillator Mode	Sys_boot 6	Internal Clock Request (Always Active-High)	External Clock Request (Note: polarity depends on CLKREQ_POL)	Sys_clkreq Direction	Description
Master mode	0	0	0 ⁽¹⁾	Input (output buffer in Hi-Z) Note: Input is not driven from outside of OMAP in this case.	The clock is not requested internally or externally (external device/peripheral).
	0	0	1 ⁽¹⁾	Input (output buffer in Hi-Z)	The clock is requested externally.
	0	1	0 ⁽¹⁾	Output	The clock is requested internally.
	0	1	1 ⁽¹⁾	Output Note: The pad is driven both by OMAP and from outside of OMAP in this case.	The clock is requested internally and externally.
Bypass mode	1	0	0 ⁽¹⁾	Input (output buffer in Hi-Z) Note: Input is not driven from outside of OMAP in this case).	The clock is not requested internally or externally.
	1	0	1 ⁽¹⁾	Input (output buffer in Hi-Z)	The clock is requested externally.
	1	1	0 ⁽¹⁾	Output	The clock is requested internally.
	1	1	1 ⁽¹⁾	Output Note: The pad is driven by OMAP and from outside of OMAP in this case.	The clock is requested internally and externally.

⁽¹⁾ Case when PRM_POLCTRL.CLKREQ_POL = 1 (sys_clkreq active high). If PRM_POLCTRL.CLKREQ_POL = 0 (sys_clkreq active low), these values should be inverted in Table 4-33.

4.7.5.2 System Clock Oscillator Control

Depending on the hardware configuration, the device can receive the system clock from an external source or generate it locally using the internal system clock crystal oscillator. Thus, the device oscillator has two possible operating modes:

- Master (oscillator enable) mode: The oscillator is enabled and connected to an external quartz. It provides the system clock to the device. The oscillator is activated on a device wakeup or on an external clock request. It is set to the power-down (off) state when the device switches to off mode (see Table 4-35), except when the external system clock request is active on sys_clkreq pin.
- Bypass (oscillator inactive) mode: The system clock is supplied by an external device and the oscillator is always set in bypass mode. The oscillator is insensitive to the external system clock request on the sys_clkreq pin.

NOTE: An external pullup or pulldown tied on the sys_boot6 input pin of the device determines whether the oscillator is in master or bypass mode. See Section 4.3.1, *External Clock Signals*.

When operating in master mode, the device receives an external clock request (sys_clkreq) and provides the oscillator clock (OSC_SYS_CLK) to external peripherals through the sys_clkout1 pin; in bypass mode, the device generates a clock request to the external clock source to request the system clock.

The selected mode of the oscillator can be read from the PRCM.[PRM_CLKSRC_CTRL](#)[1:0] SYSCLKSEL bit field.

Regardless of oscillator mode, the oscillator can be powered down when the device enters inactive, retention or off mode, unless an external system clock request is active (from the sys_clkreq pin). This setting is configured in the PRCM.[PRM_CLKSRC_CTRL](#)[4:3] AUTOEXTCLKMODE bit field. [Table 4-35](#) lists the four possible operation modes of the system clock.

Table 4-34. System Clock Operation Modes

AUTOEXTCLKMODE	System Clock Mode	Oscillator Mode	Description
0x0	Always-active mode	Master	The oscillator is kept active even when the clock is not requested by the device internally (all device clocks are inactive) or externally (the sysclkreq input signal is not asserted).
		Bypass	The sys_clkreq output signal is permanently asserted by the device, regardless of its internal clock states (active or inactive).
0x1	Off when device in inactive, retention, or off state	Master	The oscillator is switched to off mode when the device is in inactive, retention, or off mode and the sys_clkreq input signal is not asserted.
		Bypass	The sys_clkreq output signal is deasserted when the device is in idle, retention, or off mode.
0x2	Off when device in retention or off state	Master	The oscillator is switched to off mode when the device is in retention or off mode and the sys_clkreq input signal is not asserted.
		Bypass	The sys_clkreq output signal is deasserted when the device is in retention or off mode.
0x3	Off when device in off state	Master	The oscillator is switched to off mode when the device is in off mode and the sys_clkreq input signal is not asserted.
		Bypass	The sys_clkreq output signal is deasserted when the device is in off mode.

To exit power-down mode, the oscillator requires a device wakeup or an external clock request.

The device allows configuring of the system clock stabilization time to ensure a stable system clock in the device. This delay is configured in the PRCM.[PRM_CLKSETUP](#)[15:0] SETUP_TIME bit field.

[Figure 4-55](#) shows the system clock oscillator controls in the device.

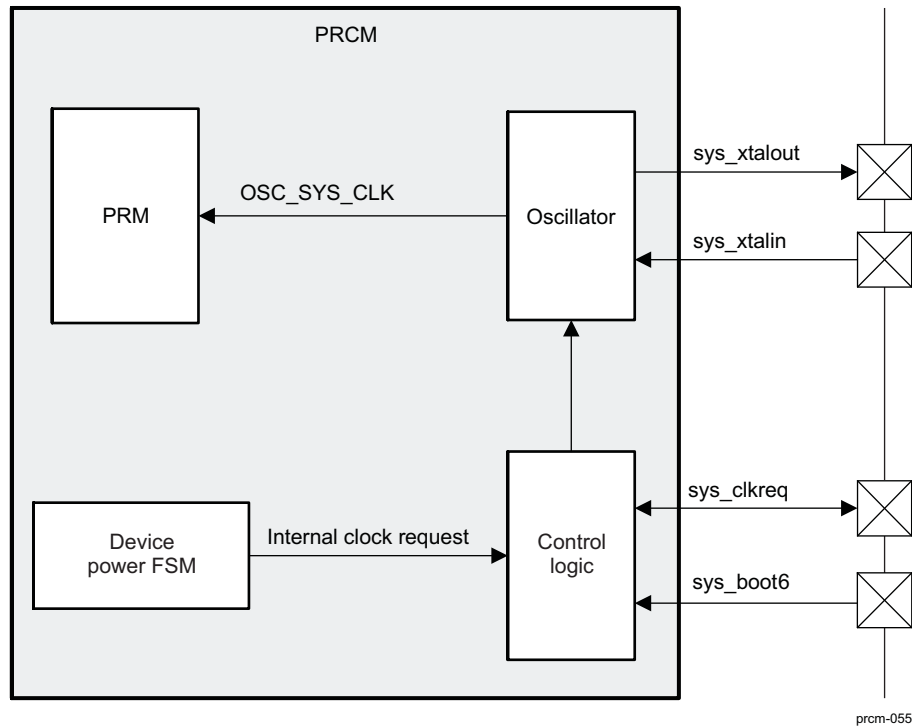

Figure 4-55. System Clock Oscillator Controls

Table 4-35 lists the oscillator controls.

Table 4-35. Oscillator Controls

Oscillator Mode	Internal Clock Request ⁽¹⁾	External Clock Request ⁽¹⁾	Oscillator State	sys_clkreq Pad Direction	sys_clkreq ⁽¹⁾	Description
Master	Not asserted	Not asserted	Off	Input and output	Not asserted	System clock not requested internally (within the device) or externally (by an external device or peripheral)
	Not asserted	Asserted	Active	Input	Asserted	System clock is requested externally only.
	Asserted	Not asserted	Active	Output	Asserted	System clock is requested internally only.
	Asserted	Asserted	Active	Input and output (driven internally by device and externally by peripheral)	Asserted	System clock is requested internally and externally.
Bypass	Not asserted	x ⁽²⁾	Bypass	Input and output (when external request is not asserted) or input (when external request is asserted)	External clock request state	System clock is not requested internally (sys_clkreq input has no effect).
	Asserted	x ⁽²⁾	Bypass	Output (when only internal request is asserted) or input and output (when external and internal request are asserted)	Asserted	System clock is requested internally (sys_clkreq input has no effect).

⁽¹⁾

- If the PRCM.PRM_POLCTRL[1] CLKREQ_POL is set to active high (0x1), Asserted = 1, and Not asserted = 0.
- If the PRCM.PRM_POLCTRL[1] CLKREQ_POL is set to active low (0x0), Asserted = 0, and Not asserted = 1.

⁽²⁾ x indicates that the signal may be asserted or not asserted.

4.7.5.3 External Output Clock1 (sys_clkout1) Control

The sys_clkout1 clock is active if the oscillator clock (OSC_SYS_CLK) is active (stable) and an external system clock request is active. It can be gated by programming the PRCM.PRM_CLKOUT_CTRL[7] CLKOUT_EN bit. The polarity of the sys_clkout1 signal, when the clock is gated, is controllable by programming the PRCM.PRM_POLCTRL[2] CLKOUT_POL bit.

When the device is in standby mode, SYS_CLK and sys_clkout1 are disabled. In this case, reactivation of sys_clkout1 depends on the oscillator mode:

- Oscillator in active mode (sys_boot6 is 0): The sys_clkout1 clock can be reactivated (after oscillator stabilization), provided its gating was enabled by programming the PRCM.PRM_CLKOUT_CTRL[7] CLKOUT_EN bit and asserting an external clock request. This activation does not generate a device wake-up event; an external clock request activates only the internal SYS_CLK oscillator and sys_clkout1.
- Oscillator in bypass mode (sys_boot6 is 1): The sys_clkout1 clock can be reactivated only after the device wakes up (on any wake-up event) and SYS_CLK is active. When the device is active, SYS_CLK is running and sys_clkout1 is enabled as soon as requested by software.

4.7.5.4 External Output Clock2 (sys_clkout2) Control

A second output clock, sys_clkout2, is generated with a frequency that can be the source-clock frequency divided by 1, 2, 4, 8, or 16. Its source clock can be CORE_CLK, CM_SYS_CLK, 96 MHz, or 54 MHz. Unlike sys_clkout1, this second external clock is not active when the device is in off power mode. Also, the selected source clock must be enabled by software. Enabling sys_clkout2 does not automatically request the required source clock. The polarity of the sys_clkout2 signal, when the clock is gated, is controllable by programming the PRCM.CM_POLCTRL[0] CLKOUT2_POL bit.

4.7.6 DPLL Control

The PRCM module allows the configuration of the output clock frequencies of the DPLLs by setting their multipliers and dividers. It also allows control of the operating mode of the DPLLs and automatic recalibration mode.

4.7.6.1 DPLL Multiplier and Divider Factors

DPLL clock outputs are set by programming the corresponding multiplier and divider factors M, N, M2, M3, M4, M5, and M6. [Table 4-36](#) lists the register bit fields for configuration of the multiplier and divider factors for the DPLLs.

Table 4-36. DPLL Multiplier and Divider Factors

	DPLL1	DPLL2	DPLL3	DPLL4	DPLL5
M	PRCM.CM_CLKSEL1_PLL_MPU[18:8] MPU_DPLL_MULT	PRCM.CM_CLKSEL1_PLL_IVA2[18:8] IVA2_DPLL_MULT	PRCM.CM_CLKSEL1_PLL[26:16] CORE_DPLL_MULT	PRCM.CM_CLKSEL2_PLL[18:8] PERIPH_DPLL_MULT	PRCM.CM_CLKSEL4_PLL[18:8] PERIPH2_DPLL_MULT
N	PRCM.CM_CLKSEL1_PLL_MPU[6:0] MPU_DPLL_DIV	PRCM.CM_CLKSEL1_PLL_IVA2[6:0] IVA2_DPLL_DIV	PRCM.CM_CLKSEL1_PLL[14:8] CORE_DPLL_DIV	PRCM.CM_CLKSEL2_PLL[6:0] PERIPH_DPLL_DIV	PRCM.CM_CLKSEL4_PLL[6:0] PERIPH2_DPLL_DIV
M2	PRCM.CM_CLKSEL2_PLL_MPU[4:0] MPU_DPLL_CLKOUT_DIV	PRCM.CM_CLKSEL2_PLL_IVA2[4:0] IVA2_DPLL_CLKOUT_DIV	PRCM.CM_CLKSEL1_PLL[31:27] CORE_DPLL_CLKOUT_DIV	PRCM.CM_CLKSEL3_PLL[4:0] DIV_96M	PRCM.CM_CLKSEL5_PLL[4:0] DIV_120M
M3	Not used	Not used	PRCM.CM_CLKSEL1_EMUJ[20:16] DIV_DPLL3	PRCM.CM_CLKSEL_DSS[12:8] CLKSEL_TV	Not used
M4	Not used	Not used	Not used	PRCM.CM_CLKSEL_DSS[4:0] CLKSEL_DSS1	Not used
M5	Not used	Not used	Not used	PRCM.CM_CLKSEL_CAM[4:0] CLKSEL_CAM	Not used
M6	Not used	Not used	Not used	PRCM.CM_CLKSEL1_EMUJ[28:24] DIV_DPLL4	Not used

4.7.6.2 DPLL Modes

DPLL supports several power modes (see [Table 4-37](#)). Each mode results in a tradeoff between power savings and relock time.

Table 4-37. DPLL Power Modes

Mode	Clock Input	Clock Output	DPLL Power State	Power Consumption	Latency
Locked	On	Lock frequency	ON	Maximum	N/A
Low-power bypass	On	Bypass frequency	ON	Less than locked	Same as low-power stop
Fast-relock bypass	On	Bypass frequency	ON	Less than locked	Less than low-power bypass
Low-power stop	On	Bypass frequency	ON	Less than locked	Same as low-power bypass
MN bypass	On	Bypass frequency	ON	Less than locked	Maximum
Off	Off	Off	Off	Minimum	Maximum

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions. After a device power-on reset, the DPLL can be kept in low-power stop mode (DPLL2, DPLL4, and DPLL5) or MN bypass mode (DPLL1 and DPLL3).

A DPLL can switch from one mode to the other as a result of the following:

- Software-programmed transition only (manual): The software configures a dedicated register for the next desired DPLL mode. It must ensure that the transition can be performed based on the activity on the device.
- Combined software-programmed and hardware-conditions-based transition (automatic): The PRCM module triggers the transition when the software requests it (by configuring the registers) and the hardware conditions are satisfied. When the hardware conditions are no longer met, the PRCM module triggers the return transition.

For automatic transition, automatic mode must be enabled by programming the `PRCM.CM_AUTOIDLE_PLL` or the `PRCM.CM_AUTOIDLE_PLL<processor_name>` registers.

Table 4-38 describes the manual and automatic control of the DPLL power modes by the PRCM module.

Table 4-38. DPLL Power Mode Support

Mode	DPLL1	DPLL2	DPLL3	DPLL4	DPLL5
Locked	Software request (manual) or MPU wakes up (automatic).	Software request (manual) or IVA2.2 wakes up (automatic).	Software request (manual) or CORE wakes up (automatic).	Software request (manual) or at least one peripheral clock is used (automatic).	Software request (manual) or at least one peripheral clock is used (automatic).
Low-power bypass	Software request (manual)	Software request (manual)	Software request (manual) or all interface clocks are gated (automatic).	N/A	N/A
Fast-relock bypass	N/A	N/A	Software request (manual)	N/A	N/A
Low-power stop	MPU is idle (automatic).	Software request (manual) or IVA2.2 is idle (automatic) or on global reset release (automatic).	Device is idle (automatic).	(Default state) Software request (manual) or all functional clocks from DPLL are unused or on global reset release (automatic).	(Default state) Software request (manual) or all functional clocks from DPLL (120-MHz clock) are unused or on global reset release (automatic).
MN bypass	Global reset (automatic)	N/A	Global reset (automatic)	N/A	N/A
Off	Device off (automatic)	Device off (automatic)	Device off (automatic)	Device off (automatic)	Device off (automatic)

NOTE: DPLL1 and DPLL3 cannot be manually forced to switch to Low-Power Stop mode from any other power mode. They must be in Locked state with automatic transition to Low-Power Stop mode configured and the hardware condition for the transition (identified in [Table 4-38](#)) must be satisfied, in order to switch to the Low-Power Stop mode.

[Table 4-39](#) lists the bit fields that must be programmed for manual and automatic mode control of the five DPLLs.

Table 4-39. DPLL Power Mode Control

Mode	Manual Control	Auto Control
DPLL1	PRCM.CM_CLKEN_PLL_MPU[2:0] EN_MPU_DPLL	PRCM.CM_AUTOIDLE_PLL_MPU[2:0] AUTO_MPU_DPLL
DPLL2	PRCM.CM_CLKEN_PLL_IVA2[2:0] EN_IVA2_DPLL	PRCM.CM_AUTOIDLE_PLL_IVA2[2:0] AUTO_IVA2_DPLL
DPLL3	PRCM.CM_CLKEN_PLL[2:0] EN_CORE_DPLL	PRCM.CM_AUTOIDLE_PLL[2:0] AUTO_CORE_DPLL
DPLL4	PRCM.CM_CLKEN_PLL[18:16] EN_PERIPH_DPLL	PRCM.CM_AUTOIDLE_PLL[5:3] AUTO_PERIPH_DPLL
DPLL5	PRCM.CM_CLKEN2_PLL[2:0] EN_PERIPH2_DPLL	PRCM.CM_AUTOIDLE2_PLL[2:0] AUTO_PERIPH2_DPLL

NOTE: The DPLL automatically enters locked mode on a power domain wakeup only if the DPLL is locked before the sleep transition and one of the automatic modes is enabled.

4.7.6.3 DPLL Low-Power Mode

The DPLL can operate in a low-power mode by reducing the operating frequency range. This reduces the power consumption of the DPLL. In this mode, however, there is a period and phase jitter effect.

The DPLL can enter this mode only if the targeted lock frequency of the DPLL is less than 600 MHz. This implies locking or rellocking the DPLL to a new targeted locked-frequency when entering or exiting low-power mode. Software must ensure that the DPLL lock frequency does not exceed 600 MHz in low-power mode.

Software can enable/disable automatic switching of the DPLL between normal mode and low-power mode. The new mode is effective only after the DPLL is relocked. Low-power mode control is considered only during the following transitions:

- Bypass mode to lock
- Stop mode to lock
- Lock to rellock

[Table 4-40](#) lists the bit fields that must be programmed for manual control of the five DPLLs.

Table 4-40. LP Mode Control

Mode	Manual Control
DPLL1	PRCM.CM_CLKEN_PLL_MPU[10] EN_MPU_DPLL_LPMODE
DPLL2	PRCM.CM_CLKEN_PLL_IVA2[10] EN_IVA2_DPLL_LPMODE
DPLL3	PRCM.CM_CLKEN_PLL[10] EN_CORE_DPLL_LPMODE
DPLL4	PRCM.CM_CLKEN_PLL[26] EN_PERIPH_DPLL_LPMODE
DPLL5	PRCM.CM_CLKEN2_PLL[10] EN_PERIPH2_DPLL_LPMODE

4.7.6.4 DPLL Clock Path Power Down

DPLL3 and DPLL4 can power down the CLKOUTX2 path. A small section of logic is powered down, because the M2 post divider is shared with the CLKOUT path, which remains functional.

The HSDIVIDER can power down each CLKOUTn path (with n in the range of 3 to 6) independently, therefore allowing further power savings. The clock output path is also powered down when the DPLL is in stop mode, regardless of the software setting.

Software must ensure correct sequencing of the control. To avoid a glitch at the output, activate this control when the clock is not required, and when the output clock is gated. Conversely, ensure a delay between deactivation and reactivation of the clock by using the power-down control.

Table 4-41 lists the bit fields and the corresponding clock outputs of the DPLLs.

Table 4-41. Clock Path Power-Down Control

DPLL	Control Bit Field	Clock Path
DPLL4	PRCM.CM_CLKEN_PLL[27] PWRDN_96M	96-MHz clock output (DPLL4 output M2X2)
	PRCM.CM_CLKEN_PLL[28] PWRDN_TV	DSS TV clock output (DPLL4 output M3X2)
	PRCM.CM_CLKEN_PLL[29] PWRDN_DSS1	DSS1 clock output (DPLL4 output M4X2)
	PRCM.CM_CLKEN_PLL[30] PWRDN_CAM	CAM clock output (DPLL4 output M5X2)
	PRCM.CM_CLKEN_PLL[31] PWRDN_EMU_PERIPH	EMU_PERIPH clock output (DPLL4 output M6X2)
DPLL3	PRCM.CM_CLKEN_PLL[12] PWRDN_EMU_CORE	EMU_CORE clock output (DPLL3 output M3X2)

4.7.6.5 Recalibration

A lock sequence occurs during an initial lock or during a relock following a new multiplier or divider value. Each time the DPLL is reset or performs a lock sequence, it performs a recalibration of the output frequency, based on voltage and temperature conditions. By compensating for voltage and temperature changes within a certain range, calibration allows the lock frequency to remain steady. If the voltage or temperature drifts outside the acceptable range, the DPLL asserts a recalibration flag.

For example, a large temperature drift can cause the DPLL to lose its lock and require recalibration. When the DPLL locks at a temperature within the 080 degrees Celsius range, the maximum temperature drift is approximately 55 degrees Celsius. When DPLL starts at a negative temperature, the maximum temperature drift is higher.

If the DPLL locks at 30 degrees Celsius, the temperature can change by 60 degrees Celsius (from 30 to +90 degrees Celsius) and the DPLL does not lose the lock. However, for temperatures above the 60 degrees Celsius range, the DPLL may need to be relocked. A new relock sequence reinitializes the starting temperature.

This compensation mechanism is active only while the DPLL is locked. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag. If the voltage or temperature exceeds the drift limits while the DPLL is not locked, and then the DPLL tries to relock, the DPLL fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference from a standard relock is the delay.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be managed by the software. The mode of operation is selected by configuring the corresponding registers in the PRCM module (see Table 4-42). The software or manual control mode is selected by default.

NOTE: Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the SDRC is sensitive to a frequency change on DPLL3 because its embedded DLL relocks on a frequency change. Any access during this DLL relock period can be corrupted. It is important; therefore, to stall SDRC access during DPLL recalibration.

To let the software recalibrate the DPLL at the correct time depending on the device activity, the PRCM module can generate a wake-up event on the MPU power domain, followed by an interrupt on the MPU when the DPLL recalibration flag is asserted.

Table 4-42 summarizes software programming control over the DPLL recalibration feature.

Table 4-42. DPLL Recalibration Controls

DPLL	Software Control	Description
DPLL1 (MPU)	PRCM.CM_CLKEN_PLL_MPU[3] MPU_DPLL_DRIFTGUARD	Enable/disable the MPU DPLL automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[7] MPU_DPLL_RECAL_EN	Enable/disable the MPU DPLL recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[7] MPU_DPLL_ST	Status of the MPU DPLL recalibration interrupt
DPLL2 (IVA2)	PRCM.CM_CLKEN_PLL_IVA2[3] IVA2_DPLL_DRIFTGUARD	Enable/disable the IVA2 DPLL automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[8] IVA2_DPLL_RECAL_EN	Enable/disable the IVA2 DPLL recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[8] IVA2_DPLL_ST	Status of the IVA2 DPLL recalibration interrupt to MPU
	PRCM.PRM_IRQENABLE_IVA2[2] IVA2_DPLL_RECAL_EN	Enable/disable the IVA2 DPLL recalibration interrupt to IVA2.2.
	PRCM.PRM_IRQSTATUS_IVA2[2] IVA2_DPLL_ST	Status of the IVA2 DPLL recalibration interrupt to IVA2.2
DPLL3 (CORE)	PRCM.CM_CLKEN_PLL[3] EN_CORE_DPLL_DRIFTGUARD	Enable/disable the CORE DPLL automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[5] CORE_DPLL_RECAL	Enable/disable the CORE DPLL recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[5] CORE_DPLL_ST	Status of the CORE DPLL recalibration interrupt
DPLL4 (PER)	PRCM.CM_CLKEN_PLL[19] EN_PERIPH_DPLL_DRIFTGUARD	Enable/disable the PER DPLL automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[6] PERIPH_DPLL_RECAL	Enable/disable the PER DPLL recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[6] PERIPH_DPLL_ST	Status of the PER DPLL recalibration interrupt
DPLL5 (PER2)	PRCM.CM_CLKEN2_PLL[3] EN_PERIPH2_DPLL_DRIFTGUARD	Enable/disable the PER DPLL2 automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[25] SND_PERIPH_DPLL_RECAL_EN	Enable/disable the PER DPLL2 recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[25] SND_PERIPH_DPLL_ST	Status of the PER DPLL2 recalibration interrupt

NOTE: DPLL recalibration is not necessary in real use (specified operating voltage and temperature range).

4.7.6.6 DPLL Programming Sequence

The DPLL programming sequence follows:

1. Set the M and N values for the desired CLKOUT frequency (see [Section 4.7.6.1](#)).
2. Set the corresponding output dividers (M2, M3, M4, M5, and M6) (see [Section 4.7.6.1](#)).
3. Enable/disable the autorecalibration feature (see [Section 4.7.6.5](#)).
4. Enable/disable the autoidle feature (see [Section 4.7.6.2](#)).
5. Mask/unmask the interrupt to the MPU (and the DPLL2 interrupt to IVA2) (see [Section 4.7.6.5](#)).
6. Enable the DPLL lock mode (see [Section 4.7.6.2](#)).

4.7.7 Internal Clock Controls

This section describes the software and hardware controls of the internal source clocks. [Figure 4-56](#) through [Figure 4-69](#) list the clock controls. The Source selection/division column lists the PRCM register bits that select or divide the clocks. The Software control column lists the PRCM register bits that enable/disable the clocks. The Hardware control column lists the hardware conditions required to effectively gate the clocks.

In the Hardware control column, the boxes labeled CL, GS, GC, and HC indicate specific information about the hardware clock controls:

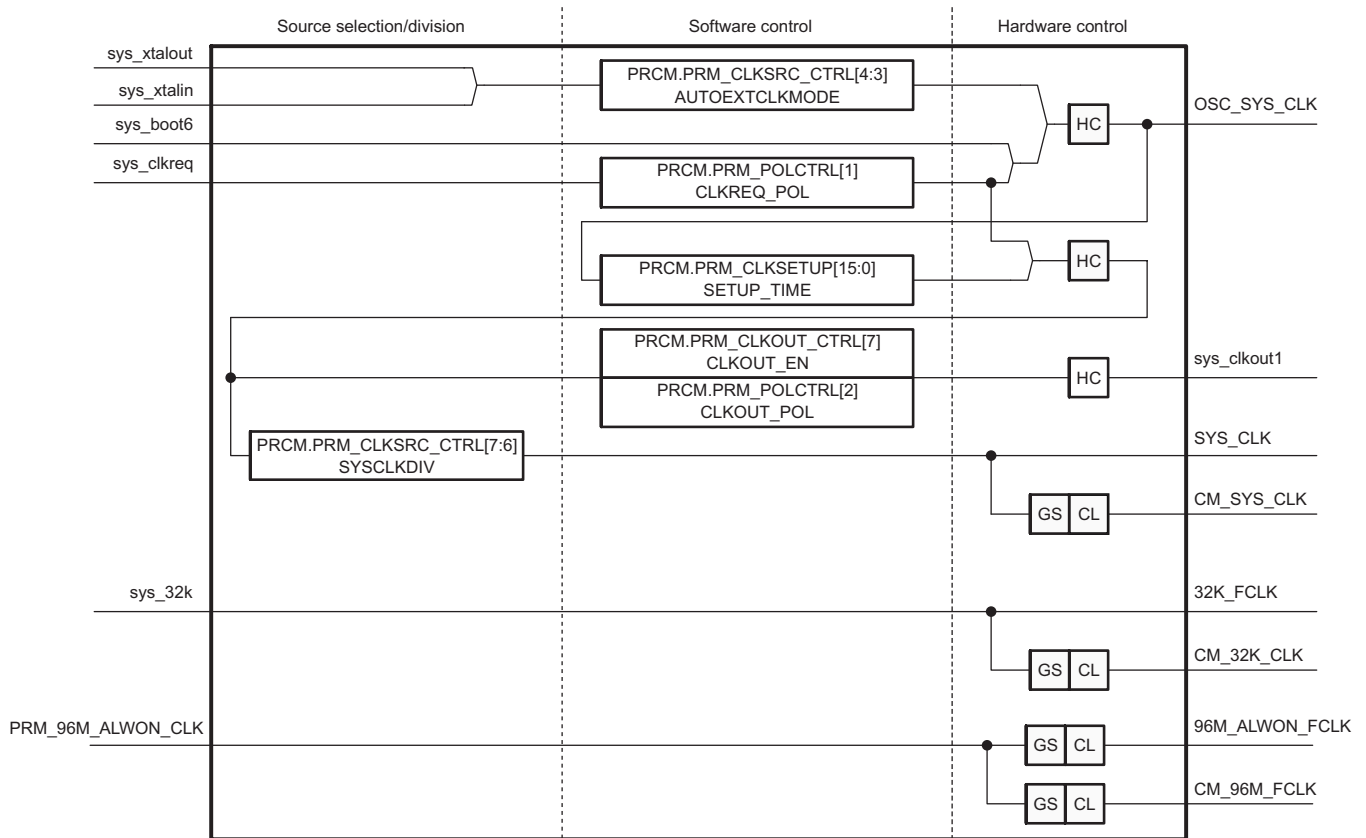

- CL (combinational logic): The functional or interface clock is required by more than one module across more than one power domain. The gating control is the OR combination of all the domain clock requests. If any module of this clock domain requests the clock, the clock is not gated.
- GS (gating selection): The clock is selectable among several possible source clocks for a module. The gating control depends on the software programming of the CM_CLKSEL_<domain_name> type of register. The clock request of the module or domain must be set by the CM_CLKSEL bit.
- GC (gating control): The functional/interface clock is required by a single module across the power domain. The gating control depends only on the software programming of the FCLKEN/ICLKEN bit. For the interface clock, the enable bit is effective only if autoidle mode is not used. If autoidle mode is used, the gating control also depends on the state of the power domain.
- HC (hardware control): A specific rule not covered by CL, GS, or GC.

NOTE: Because the PRCM module must receive hardware acknowledgement from the different modules before it can gate the clock, the clock is not gated immediately after the software requests clock-gating conditions.

4.7.7.1 PRM Source-Clock Controls

[Figure 4-56](#) shows the common source-clock controls for the PRM.

Figure 4-56. Common PRM Source-Clock Controls

prcm-056

Table 4-43 shows the common source-clock gating controls for the PRM.

Table 4-43. Common PRM Source-Clock Gating Controls

Clock Name	Reset	Clock-Gating Control	Gating Description
OSC_SYS_CLK	Running	PRCM.PRM_CLKSRC_CTRL[4:3] AUTOEXTCLKMODE and device power state and sys_clkreq	Gated when the oscillator is programmed to power down with the device sleep/retention/off transition
sys_clkout1	Running	PRCM.PRM_CLKOUT_CTRL[7] CLKOUT_EN and PRCM.PRM_POLCTRL[2] CLKOUT_POL and sys_clkreq	Active when OSC_SYS_CLK is active, sys_clkout1 is enabled, and sys_clkreq is asserted
SYS_CLK	Running	Activated after clksetup_count_overflow	Active when OSC_SYS_CLK is active and the SYS_CLK setup time is up
CM_SYS_CLK	Running	PRCM.CM_CLKSEL_CORE[6] CLKSEL_GPT10, PRCM.CM_CLKSEL_CORE[7] CLKSEL_GPT11, and depends on the clock-gating conditions of GPT10_FCLK and GPT11_FCLK	Active if it is the source clock of the GPT10_FCLK or GPT11_FCLK and the functional clock is active
32K_FCLK	Running	None	Always-active clock from the sys_32k input pin
CM_32K_CLK	Running	PRCM.CM_CLKSEL_CORE[6] CLKSEL_GPT10, PRCM.CM_CLKSEL_CORE[7] CLKSEL_GPT11, and depends on the clock-gating conditions of GPT10_FCLK and GPT11_FCLK	Active if it is the source clock of the GPT10_FCLK or GPT11_FCLK and the functional clock is active
CM_96M_FCLK	Gated	CM_CLKSEL1_PLL[3] SOURCE_48M bit cleared, and depends on the clock-gating condition of 96M_FCLK, 48M_FCLK, and 12M_FCLK	Active if the derived clocks (96M_FCLK, 48M_FCLK, and 12M_FCLK) are active
96M_ALWON_FCLK	Gated	CM_FCLKEN_PER[0] EN_MCBSP2, CM_FCLKEN_PER[1] EN_MCBSP3, and CM_FCLKEN_PER[2] EN_MCBSP4	Gated when none of the three McBSPs [2..4] have their functional clock enable requested

The oscillator output clock (OSC_SYS_CLK) is gated when the PRCM.PRM_CLKSRC_CTRL[4:3] AUTOEXTCLKMODE bit field is programmed to power down the oscillator when the device enters retention or off mode. In this condition, all the clock trees in the device must be gated, and the four DPLLs (DPLL1, DPLL2, DPLL3, and DPLL4) must enter stop mode before this transition can occur.

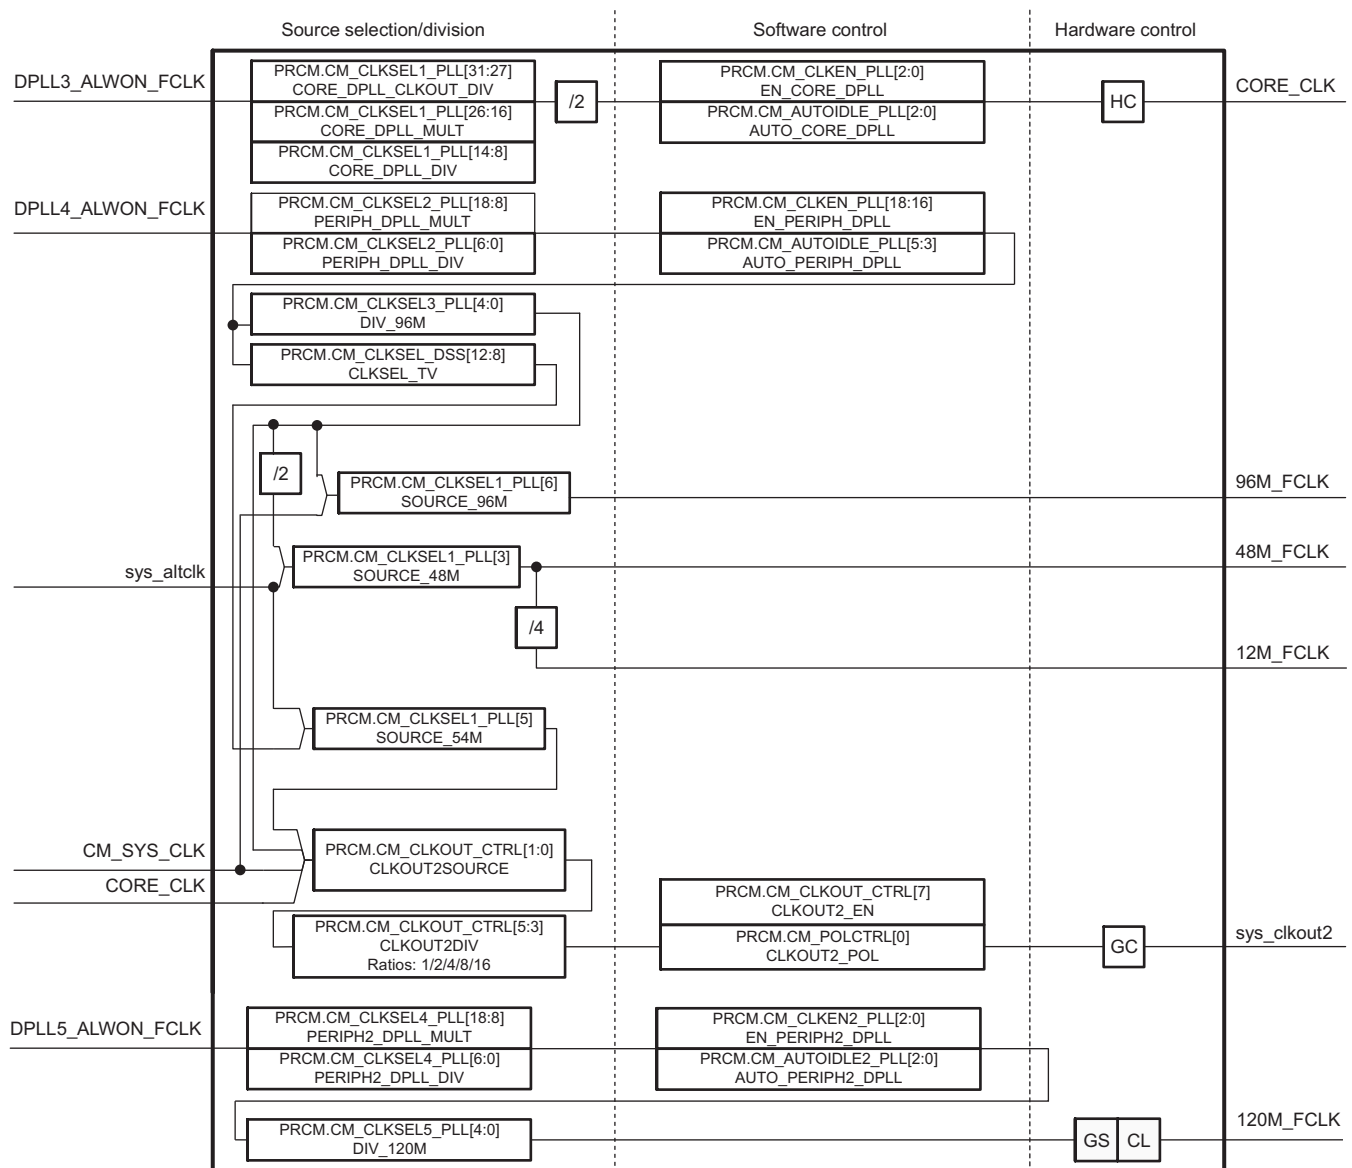

SYS_CLK is gated under the same conditions as the oscillator output clock, but it is enabled only after the oscillator stabilizes. Oscillator stabilization is determined by a counter overflow configured in the PRCM.PRM_CLKSETUP[15:0] SETUP_TIME bit field.

The sys_clkreq active condition is described in Section 4.7.5, External Clock Control.

4.7.7.2 CM Source-Clock Controls

Figure 4-57 shows the common source-clock controls for the CM.

Figure 4-57. Common CM Source-Clock Controls

prcm-057

Table 4-44 shows the common source-clock gating controls for the CM.

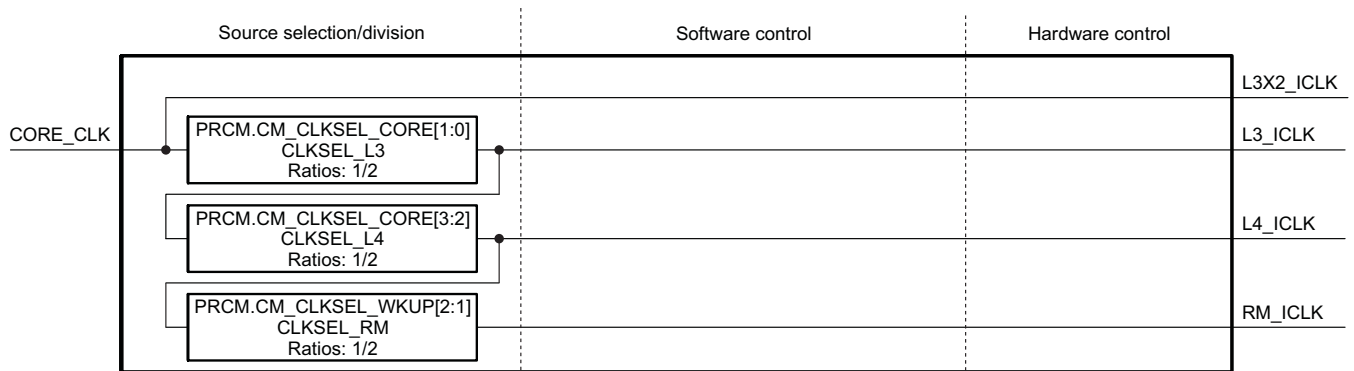

Table 4-44. Common CM Source-Clock Gating Controls

Clock Name	Reset	Clock-Gating Control	Gating Description
CORE_CLK	Running	Depends on the clock-gating conditions of: L3_ICLK and L4_ICLK	Gated when all interface clocks of the different modules of the device are gated
96M_FCLK	Stopped	Depends on the clock-gating conditions of CORE_96M_FCLK and DSS_96M_FCLK	If the dependent clocks are active, the clock is active.
48M_FCLK	Stopped	Depends on the clock-gating conditions of CORE_12M_FCLK, PER_48M_FCLK and USBHOST_48M_FCLK	If the dependent clocks are active, the clock is active.
12M_FCLK	Stopped	Depends on the clock-gating conditions of CORE_12M_FCLK	If the dependent clock is active, the clock is active.
sys_clkout2	Stopped	PRCM.CM_CLKOUT_CTRL[7] CLKOUT2_EN	Active if enabled
DPLL4_M2_CLK	Stopped	Depends on the clock-gating conditions of: 96M_FCLK	If the dependent clocks are active, the clock is active.
DPLL4_M3_CLK	Stopped	CM_CLKSEL1_PLL.SOURCE_54M and depends on the clock-gating conditions of: DPLL4_M2_CLK and DSS_TV_CLK	If the dependent clocks are active, the clock is active. DSS_TV_CLK is a dependent clock if set by the register configuration.
120M_FCLK	Stopped	CM_FCLKEN_USBHOST[1] EN_USBHOST2, CM_FCLKEN3_CORE[2] EN_USBTLL	If any of the dependent clocks (CORE_120M_FCLK or USBHOST_12M_FCLK) is active, the clock is active.

4.7.7.3 Common Interface Clock Controls

Figure 4-58 shows the clock controls for the common interface.

Figure 4-58. Common Interface Clock Controls

prcm-058

Table 4-45 shows the clock-gating controls for the common interface.

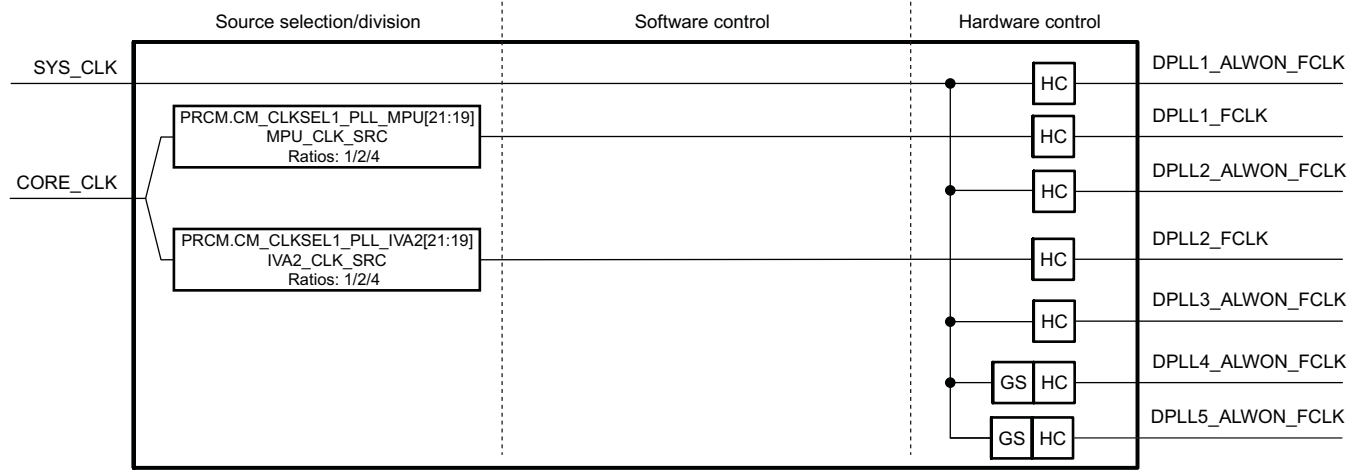

Table 4-45. Common Interface Clock-Gating Controls

Clock Name	Reset	Clock-Gating Control	Gating Description
L3X2_ICLK	Running	CORE_CLK gating conditions	Depends on the gating conditions of the CORE_CLK
L3_ICLK	Running	Depends on the clock-gating conditions of GFX_L3_ICLK, CORE_L3_ICLK, and CAM_L3_ICLK	Gated when all L3 interface clocks of the different modules of the device are gated
L4_ICLK	Running	Depends on the clock-gating conditions of CORE_L4_ICLK, CAM_L4_ICLK, DSS_L4_ICLK, PER_L4_ICLK, and WKUP_L4_ICLK	Gated when all L4 interface clocks of the different modules of the device are gated
RM_ICLK	Running	None	Gated with source clock (CORE_CLK)

4.7.7.4 DPLL Source-Clock Controls

Figure 4-59 shows the clock controls for the DPLL power domain.

Figure 4-59. DPLL Power Domain Clock Controls

prcm-059

Table 4-46 shows the clock-gating controls for the DPLL power domain.

Table 4-46. DPLL Power Domain Clock-Gating Controls

Clock Name	Reset	Clock-Gating Control	Gating Description
DPLL1_ALWON_FCLK	Running	PRCM.CM_AUTOIDLE_PLL_MPU[2:0] AUTO_MPU_DPLL, PRCM.CM_CLKEN_PLL_MPU[2:0] EN_MPU_DPLL, and MPU domain power state	Gated if the DPLL is set to automatic active control and enabled in lock mode while the MPU power domain goes into retention or off mode. Also gated if DPLL is set to low-power bypass mode.
DPLL1_FCLK	Stopped		
DPLL2_ALWON_FCLK	Stopped	PRCM.CM_AUTOIDLE_PLL_IVA2[2:0] AUTO_IVA2_DPLL, PRCM.CM_CLKEN_PLL_IVA2[2 :0] EN_IVA2_DPLL, and IVA2 power domain power state	Gated if the DPLL is set to automatic active control and enabled in lock mode while the IVA2 power domain goes into retention or off mode. Also gated if DPLL is set to low-power stop or bypass mode.
DPLL2_FCLK	Stopped		
DPLL3_ALWON_FCLK	Running	PRCM.CM_AUTOIDLE_PLL[2:0] AUTO_CORE_DPLL, PRCM.CM_CLKEN_PLL[2:0] EN_CORE_DPLL, and CORE domain power clocks state	Gated if the DPLL is set to automatic active control and enabled in lock mode while the CORE power domain is idle. Also gated if DPLL is set to low-power or fast-relock bypass mode.
DPLL4_ALWON_FCLK	Stopped	PRCM.CM_AUTOIDLE_PLL[5:3] AUTO_PERIPH_DPLL, PRCM.CM_CLKEN2_PLL[18:16] EN_PERIPH_DPLL, and depends on the clock-gating conditions of DPLL4_M2_CLK	Gated if the DPLL is set to automatic active control and enabled in lock mode while its dependent clock is inactive. Also gated if DPLL is set to low-power stop mode.
DPLL5_ALWON_FCLK	Stopped	PRCM.CM_AUTOIDLE2_PLL[2:0] AUTO_PERIPH2_DPLL, PRCM.CM_CLKEN2_PLL[2:0] EN_PERIPH2_DPLL, and depends on the clock-gating conditions of DPLL5_M2_CLK	Gated if the DPLL is set to automatic active control and enabled in lock mode while its dependent clock is inactive. Also gated if DPLL is set to low-power stop mode.

4.7.7.5 SGX Power Domain Clock Controls

To save power, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

Figure 4-60 shows the clock controls for the SGX power domain.

Figure 4-60. SGX Power Domain Clock Controls

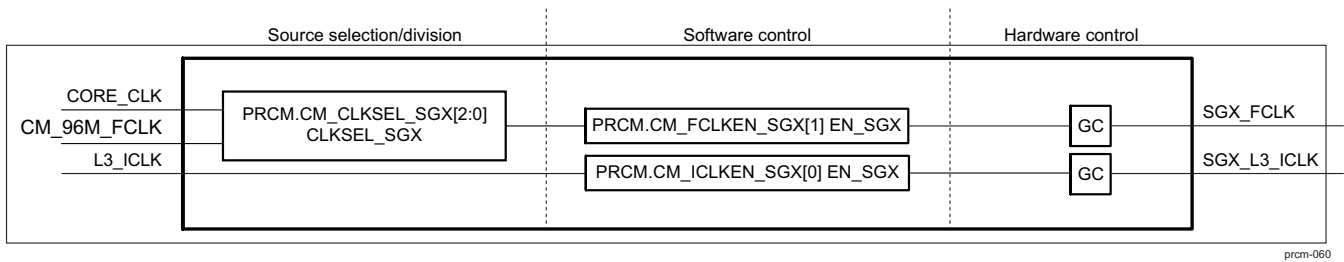

Table 4-47 lists the clock-gating controls for the SGX power domain.

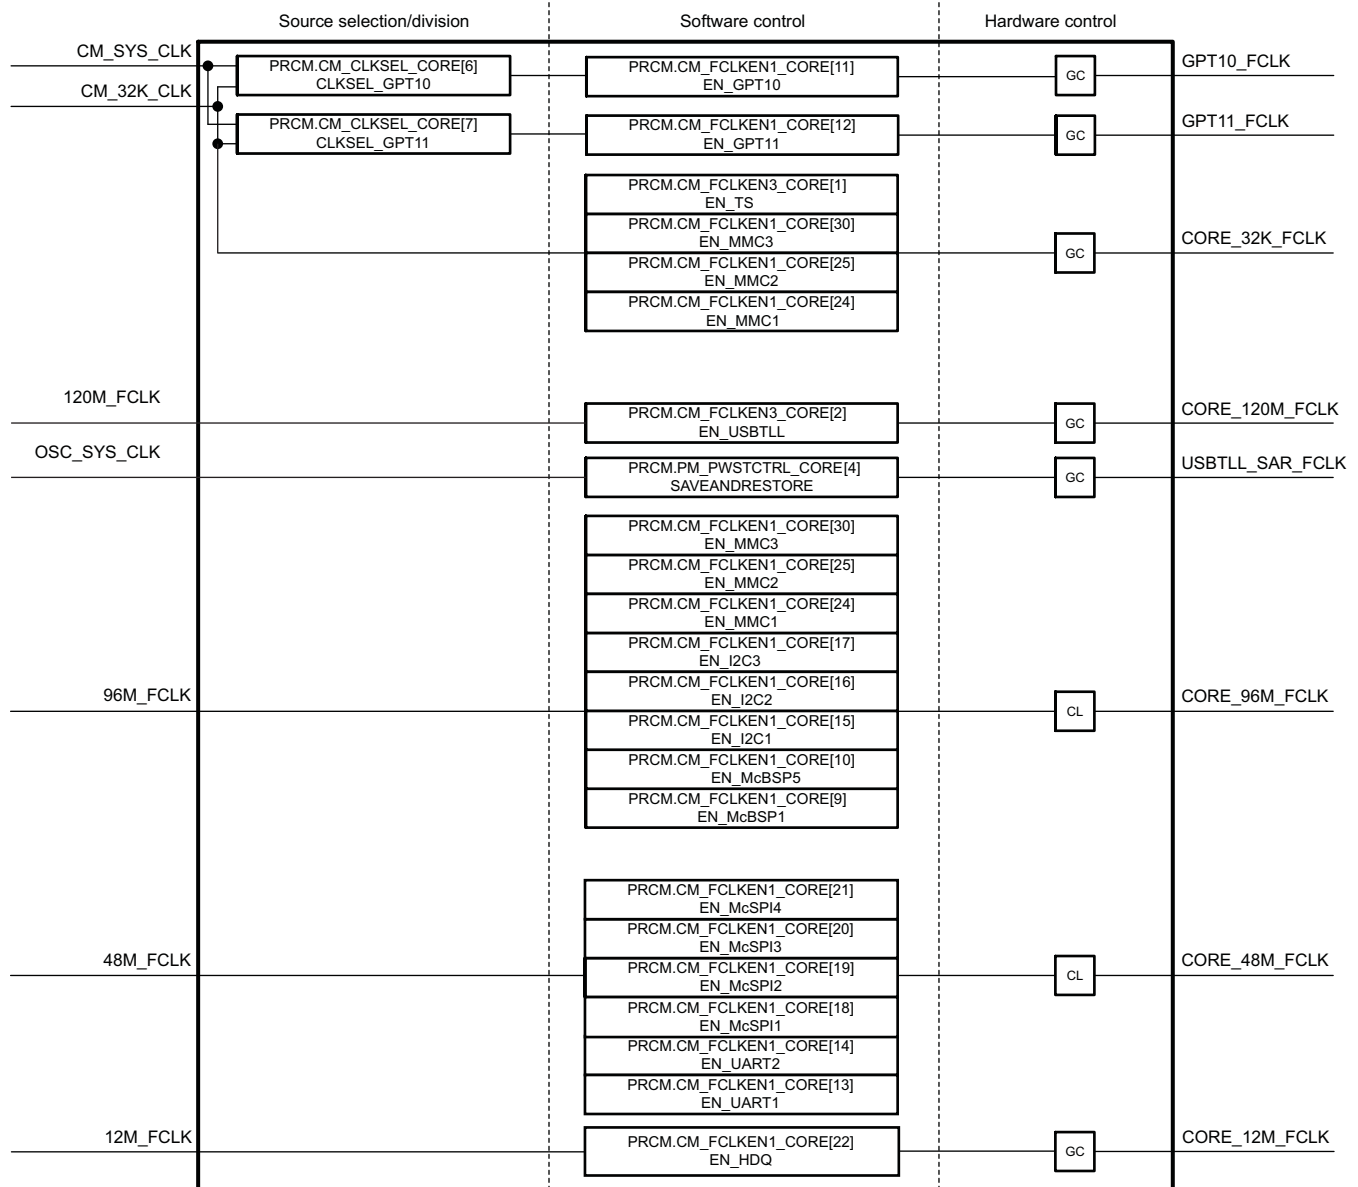

Table 4-47. SGX Power Domain Clock-Gating Controls

Clock Name	Reset	Clock-Gating Control	Gating Description
SGX_FCLK	Stopped	PRCM.CM_FCLKEN_SGX[1] EN_SGX	Gated when the enable bit is set to 0
SGX_ICLK	Stopped	PRCM.CM_ICLKEN_SGX[1] EN_SGX	Gated when the enable bit is set to 0

4.7.7.6 CORE Power Domain Clock Controls

Figure 4-61 through Figure 4-62 show the clock controls for the CORE power domain.

Figure 4-61. CORE Power Domain Clock Controls: Part 1

All enable-autoidle bit pairs are set to 1, and the clock is not requested by any module.
96M_ALWON_FCLK	Stopped	None	Always-on clock

For audio applications, the McBSP functional clocks are provided externally by the MCBSP_CLKS pin. This clock must be permanently supplied, to let McBSPs function when the CORE power domain is in the off power state. If the external clock input is selected as the functional clock, the PER power domain sleep transition is prevented.

4.7.8 Clock Configurations

The device supports several clock configurations. A clock configuration is a consistent set of divider ratios programmed into the PRCM module to obtain a certain combination of clock speed to match the performance requirement.

In the device, the MPU and IVA2.2 processors are connected to the interconnects through asynchronous bridges. The functional frequency of these processors can be configured independently of their interface clock frequency.

Therefore, the clock configurations of the device are split into two sections: one for device processor clocks and one for device interface clocks.

An OPP of the device can be defined as a pair of device operating voltage and corresponding frequency. The device processors are in the VDD1 voltage domain and the interface clocks are generated by the CM clock generator in the VDD2 voltage domain. Hence, the OPPs of the processor clocks are identified for the VDD1 voltage levels, independent of the interface clocks, which are associated with the VDD2 voltage levels.

CAUTION

Clock configuration frequencies depend on the device operating voltage values.

4.7.8.1 Processor Clock Configurations

The processor OPPs are identified as the pair of VDD1 operating voltage level and processor clock frequency.

Six generic processor OPPs can be defined as:

1. OPP6 (VDD1 = v4, (MPU_CLK = f_{mpu5} , IVA2_CLK = f_{iva5}))
2. OPP5 (VDD1 = v4, (MPU_CLK = f_{mpu4} , IVA2_CLK = f_{iva4}))
3. OPP4 (VDD1 = v3, (MPU_CLK = f_{mpu3} , IVA2_CLK = f_{iva3}))
4. OPP3 (VDD1 = v2 , (MPU_CLK = f_{mpu2} , IVA2_CLK = f_{iva2}))
5. OPP2 (VDD1 = v1 , (MPU_CLK = f_{mpu1} , IVA2_CLK = f_{iva1}))
6. OPP1 (VDD1 = v0 , (MPU_CLK = f_{mpu0} , IVA2_CLK = f_{iva0}))

where $v4 > v3 > v2 > v1 > v0$,

$f_{mpu5} > f_{mpu4} > f_{mpu3} > f_{mpu2} > f_{mpu1} > f_{mpu0}$,

$f_{iva5} > f_{iva4} > f_{iva3} > f_{iva2} > f_{iva1} > f_{iva0}$ and

f_{mpu} may not be equal to f_{iva}

The clock configuration for the MPU and the IVA applies to the following clocks of the device:

- DPLL1 (MPU DPLL) synthesized clock frequency (CLKOUTX2) configured by setting the M and N parameters of the DPLL
- DPLL1 (MPU DPLL) output clock frequency (MPU_CLK) configured by setting the M2 parameter of the DPLL

NOTE: The MPU_CLK is divided by 2 in the MPU subsystem to generate the ARM_FCLK. This divider is active only when the DPLL is locked. (For information about ARM_FCLK, see [Chapter 3, MPU Subsystem.](#))

- DPLL2 (IVA2 DPLL) synthesized clock frequency (CLKOUT) configured by setting the M and N parameters of the DPLL
- DPLL2 (IVA2 DPLL) output clock frequency (IVA2_CLK) configured by setting the M2 parameter of the DPLL

The frequency of the processor clocks (MPU_FCLK and IVA2_FCLK) must be configured according to the selected OPP (the clock frequency associated with the operating voltage VDD1). [Table 4-55](#) identifies the clocks of the processors, their source clocks, and the configuration register bit fields.

Table 4-55. Processor Clock Configuration Controls

Module	Clocks	Reference Clock	Multiplier (Factors)	Divider (Factors)	Configuration Bits
DPLL1	CLKOUTX2	SYS_CLK	M (0 ... 2047)		PRCM.CM_CLKSEL1_PLL_MPU[18:8] MPU_DPLL_MULT
				N (0 ... 127)	PRCM.CM_CLKSEL1_PLL_MPU[6:0] MPU_DPLL_DIV
	MPU_CLK ⁽¹⁾	CLKOUTX2		M2	PRCM.CM_CLKSEL2_PLL_MPU[4:0] MPU_DPLL_CLKOUT_DIV
DPLL2	CLKOUT	SYS_CLK	M (0 ... 2047)		PRCM.CM_CLKSEL1_PLL_IVA2[18:8] IVA2_DPLL_MULT
				N (0 ... 127)	PRCM.CM_CLKSEL1_PLL_IVA2[6:0] IVA2_DPLL_DIV
	IVA2_CLK	CLKOUT		M2 (1 ... 16)	PRCM.CM_CLKSEL2_PLL_IVA2[4:0] IVA2_DPLL_CLKOUT_DIV

⁽¹⁾ The MPU_CLK is divided by 2 in the MPU subsystem to generate the ARM_FCLK. This divider is active only when the DPLL is locked. For information about ARM_FCLK, see [Chapter 3, MPU Subsystem.](#)

Table 4-56. Processor Clock Configurations

DPLL State	BYPASS	LOCKED
MPU_CLK	DPLL1_FCLK (bypass clock from DPLL3)	(SYS_CLK * M * 2)/([N+1] * M2)
ARM_FCLK	MPU_CLK	MPU_CLK/2

Table 4-56. Processor Clock Configurations (continued)

DPLL State	BYPASS	LOCKED
MPU subsystem internal module clocks	ARM_FCLK/2	ARM_FCLK/2

4.7.8.2 Interface and Peripheral Functional Clock Configurations

The interface clock OPPs are identified as the pair of VDD2 operating voltage level and the device interface clocks frequencies.

The DPLL3 (CORE DPLL) generates the CORE_CLK, which serves as the source clock for the L3_ICLK and L4_ICLK interface clocks of the device. The CORE_CLOCK is also used by the DPLL1 and DPLL2 as the bypass clock. The L3_ICLK is supplied to the SGX module as SGX_L3_ICLK and is used as its functional clock. The L4_ICLK is used by RM_L4_CLK as its source clock.

The interface and peripheral functional clock frequencies can be configured according to the device performance requirements for the OPP.

DPLL3 synthesized clock frequencies are configured as:

- $f_{\text{CLKOUT}} = (f_{\text{SYS_CLK}} \times M) / (N+1)$
- $f_{\text{CLKOUTX2}} = f_{\text{CLKOUT}} \times 2$

DPLL3 output clock frequencies are configured as:

- $f_{\text{CORE_CLK}} = f_{\text{CLKOUT}} / M2$
- $f_{\text{COREX2_CLK}} = f_{\text{CLKOUTX2}} / M2$

L3_ICLK, L4_ICLK and RM_L4_ICLK frequencies are configured as:

- $f_{\text{L3_ICLK}} = f_{\text{CORE_CLK}} / \text{DIV_L3}$
- $f_{\text{L4_ICLK}} = f_{\text{L3_ICLK}} / \text{DIV_L4}$
- $f_{\text{RM_L4_ICLK}} = f_{\text{L4_ICLK}} / \text{DIV_RM}$

Table 4-57 identifies the interface clocks, their reference clocks, and the control bits for configuration of the interface clock frequencies.

Table 4-57. Interface Clock Configuration Controls

Module	Clock	Reference Clock	Multiplier (Factor)	Divider (Factor)	Configuration Bits
DPLL3	CLKOUT	SYS_CLK	M (0 ... 2047)		PRCM.CM_CLKSEL1_PLL[26:16] CORE_DPLL_MULT
	CLKOUTX2			N (0 ... 127)	PRCM.CM_CLKSEL1_PLL[14:8] CORE_DPLL_DIV
CORE_CLK	CORE_CLK	CLKOUT		M2 (1 ... 31)	PRCM.CM_CLKSEL1_PLL[31:27] CORE_DPLL_CLKOUT_DIV
	COREX2_CLK	CLKOUTX2			
L3 interconnect	L3_ICLK	CORE_CLK		DIV_L3 (1 ... 2)	PRCM.CM_CLKSEL_CORE[1:0] CLKSEL_L3
L4 interconnect	L4_ICLK	L3_ICLK		DIV_L4 (1 ... 2)	PRCM.CM_CLKSEL_CORE[3:2] CLKSEL_L4
RM clock	RM_L4_ICLK	L4_ICLK		DIV_RM (1 ... 2)	PRCM.CM_CLKSEL_WKUP[2:1] CLKSEL_RM

SGX_FCLK, DPLL1_FCLK (bypass mode) and DPLL2_FCLK (bypass mode) frequencies are configured as:

- $f_{\text{SGX_FCLK}} = f_{\text{CORE_CLK}} / \text{DIV_SGX}$
- $f_{\text{SGX_FCLK}} = f_{\text{CM_96M_FCLK}}$
- $f_{\text{DPLL1_FCLK}} = f_{\text{CORE_CLK}} / \text{DIV_DPLL1}$
- $f_{\text{DPLL2_FCLK}} = f_{\text{CORE_CLK}} / \text{DIV_DPLL2}$

Table 4-58 identifies the functional clocks, their reference clocks, and the control bits for configuration of the functional clock frequencies.

Table 4-58. Functional Clock Configuration Controls

Module	Clock	Reference Clock	Divider (Factor)	Configuration Bits
SGX	SGX_FCLK	CORE_CLK	DIV_SGX (3, 4, 6)	PRCM.CM_CLKSEL_SGX[2:0] CLKSEL_SGX
		CM_96M_FCLK		
MPU HS bypass	DPLL1_FCLK	CORE_CLK	DIV_DPLL1 (1, 2, 4)	PRCM.CM_CLKSEL1_PLL_MPU[20:19] MPU_CLK_SRC
IVA2 HS bypass	DPLL2_FCLK	CORE_CLK	DIV_DPLL2 (1, 2, 4)	PRCM.CM_CLKSEL1_PLL_IVA2[20:19] IVA2_CLK_SRC

The rest of the functional clocks are issued from DPLL4 and DPLL5 and remain invariable, regardless of the interface clock configuration. In all clock configurations, any divider ratio to generate functional clocks is applicable, provided it complies with the maximum frequency specification.

CAUTION

Before any transition to OPP1 or OPP2, set the DPLL2 bypass clock to CORE_CLK/4 in the [CM_CLKSEL1_PLL_IVA2\[20:19\] IVA2_CLK_SRC](#) bit field. During relock phase, the DSP clock is 83 MHz. This has no effect on performance because DPLL2 relock time is only a few μ s.

Before any transition to OPP1 for DPLL1, set the DPLL1 bypass clock to CORE_CLK/4 in the [CM_CLKSEL1_PLL_MPU\[20:19\] MPU_CLK_SRC](#) bit field. Otherwise, set the DPLL1 bypass clock to CORE_CLK/2.

4.8 PRCM Idle and Wake-Up Management

4.8.1 Overview

When a group of modules belonging to a clock domain in a power domain does not require a clock (interface or functional), the PRCM module can be programmed to automatically cut the clock to these modules, thereby reducing their power consumption. The PRCM module can then switch the power domain to low-power retention or off mode to ensure minimum power consumption. When all clocks in a domain are cut, the domain is idle.

Similarly, when a module belonging to a power domain in low-power idle mode is required to switch to active mode, the PRCM module switches on the power to the entire power domain and activates the necessary clock signals to the module. This is a wake-up transition. Generally, a wake-up event triggers the wake-up transition.

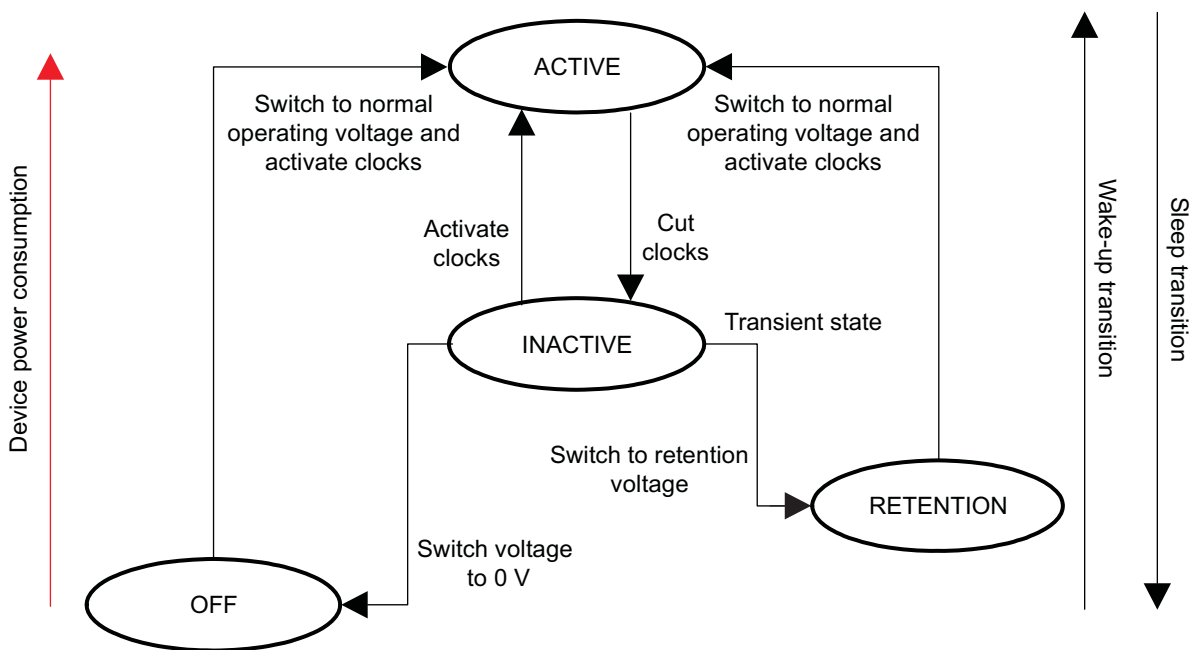

A sleep/wake-up dependency can be defined between power domains. A sleep dependency ensures that a power domain does not make a sleep transition unless all the dependent power domains are in idle mode and do not require the power domain. Similarly, a wake-up dependency ensures that a power domain wakes up when any of its dependent power domains wakes up.

The PRCM module automatically handles the sequence clock-gating conditions and power switching for each power domain, based on the configured dependencies between the domains and the clock-control bits of the modules.

Figure 4-70 shows the sleep/wake-up transition of the power domains. The inactive state is a transient power state of a power domain, while moving from active to retention or off power state. In inactive state, all the domain clocks are gated. A power domain cannot switch from off to retention or retention to OFF power state without passing to the active power state.

A low-power state (inactive, retention, or off) means less power consumption. However, wake-up latency increases as the power domain switches to inactive, retention, or off power state.

Figure 4-70. Power Domain Sleep/Wake-Up Transition

prcm-071

Functionally, the PRCM module is composed of a single global control block and a power-control block for each power domain. The domain power-control block handles power switching, wake-up events, and clock-gating control for the domain. The domain power controllers communicate with each other for power sequencing, sleep dependencies, and wake-up dependencies. All these blocks interact with the global control block that handles reset management, clock generation and distribution, and all PRCM registers.

Figure 4-71. Device Power Reset and Clock Controllers

prcm-072

Figure 4-71 shows the functions in one power domain block:

- A module clock controller (for example, module X clock controller) uses a hardware handshake protocol to communicate directly with the module. It controls the idle transition of the target module and responds to the standby requests of the initiator module (for details, see [Section 4.1.4.2, Autoidle Clock Control](#)). Depending on the mode, the clock controller sends clock commands (enable/disable) to the clock generator. The registers that control the functional and interface clocks in the module are directly mapped to the module clock controller.
- The domain clock controller gathers information from the following:
 - All module clock controllers of the power domain
 - The domain power controller
 - The domain wake-up controller
 - The other power domain control blocks

The domain clock controller informs the domain power controller when all conditions for the domain power transition are met (domain clocks are idle, no initiator is requesting service, no wake-up event is pending) to allow a domain power transition. On a wake-up event, the domain clock controller starts the module domain clocks, if power is present.

- The domain power controller communicates with the domain clock controller, the domain wake-up controller, and the domain power controller .
- The domain wake-up controller gathers all events that can wake up the power domain. Some events are active only when the domain is on (these switch on the clocks, when required); others also allow domain power up. These events can be internal (coming from the modules in the power domain, such as general-purpose [GP] timer time-out), external (coming from another power domain control block

dependency), or global (voltage stabilization).

- The reset manager globally controls all resets in the device. It gathers information from all power domain control blocks to sequence power and clocks, and resets the activation of each domain.
- The clock generator generates and distributes clocks over the device, depending on requests from all module clock controllers and on other global conditions.

4.8.2 Sleep Transition

The PRCM module can initiate a domain sleep transition on a power domain only if the domain meets the following conditions:

- All initiator modules are idle (they have completed their activity and idled themselves through software requests).
- All target modules are idle (automatically when all initiators are in standby mode or on software request).
- All sleep dependencies with other domains are met (can be set by software).

When the sleep conditions are met (based on the settings of the PRCM.PRM_PWSTCTRL_<power domain>[1,0] POWERSTATE bit field), the PRCM module performs the actions described in [Table 4-59](#) automatically or when instructed by the software.

Table 4-59. Power-State-Related Sleep Transition Actions

Power Domain State	Action
ON	All functional and interface clocks in the power domain are shut down when the sleep conditions are met. The power domain is idle and is not functional.
Retention	The power domain is idle and part or all of the logic and memory of the domain is switched to retention mode.
Off	The domain is idled and all the logic and memory in the domain are switched off.

The power domain state transition can be set to automatic (hardware controlled) or software-controlled by setting the PRCM. CM_CLKSTCTRL_<power domain> CLKTRCTRL_<power domain> bit field.

4.8.3 Wakeup

A wake-up event switches on two domains:

- A power domain (logic and associated memories) that is in inactive state
- A clock domain (including related clock sources, such as a DPLL)

If a domain is already on and the clock domain is idle, only the clocks are reactivated on a wake-up event.

To wake up, a processor requires an interrupt associated with the wake-up event. If its power domain is to transition from off or retention state to active, it must be reset.

There are three types of wake-up events:

- Global: Generated on a particular device event (device wakeup, voltage transition completed, DPLL recalibration, etc.). Used mainly to wake up the MPU domain
- Module: Functional wake-up event issued from a module, which wakes up the domain where the module resides. It can also directly wake up the MPU or the IVA2.2 processor, depending on software settings in the PRCM.PM_MPUGRPSEL_<power domain> and PRCM.PM_IVA2GRPSEL_<power domain> registers.
- Dependency: A power domain can wake up on the wakeup of another power domain. The dependency is software-controllable by configuring the PRCM.PM_WKDEP_<power domain> register.

4.8.4 Device Wake-Up Events

This section summarizes the wake-up events for each power domain. [Table 4-60](#) through [Table 4-70](#) list the wake-up events, related control registers, and MPU and IVA2.2 interrupts.

Two registers, PRCM.PRM_IRQENABLE_MPU and PRCM.PRM_IRQENABLE_IVA2, enable the MPU and IVA2.2 interrupts. In some cases, they can also enable the wake-up feature associated with the interrupt (DPLL recalibration requests, voltage controller and processors errors, and device wake-up event).

NOTE:

- The PRCM module can be configured to generate an interrupt to the MPU or the IVA2 subsystem as a result of a wake-up event from the CORE, WKUP, and PER power domain modules to the MPU and the IVA2. However, these modules can also directly interrupt the MPU and the IVA2 subsystems. To avoid a double interrupt (from the PRCM module and one of these modules) as the result of a single event (wake-up), one interrupt must be masked when the other is unmasked. For more information about the interrupt capability of a module, see the module chapter.
- The UART, GPIO, and McSPI modules generate an asynchronous wake-up event (their interface and functional clocks can be gated during the sleep period). However, because the GPTIMERS generate a synchronous wake-up event, they require their functional clock to be active during the sleep period; their interface clock can be gated. McBSP modules can generate a synchronous or asynchronous wake-up event, based on the mode configurations. For more information about the interrupt capability of a module, see the module chapter.
- The ability of a module to generate a wake-up event depends on the power state of the power domain in which the module resides. If the power domain is inactive (the functional and interface clocks of the domain are gated), only the asynchronous wake-up modules can wake up the power domain. If only the interface clocks in the domain are gated, synchronous and asynchronous wake-up modules can generate a wake-up event to activate the interface clock. Similarly, if the power domain is in retention or off power state (the domain logic is nonfunctional), no wake-up event can be generated by any module in that power domain.

Table 4-60. MPU Power Domain Wake-Up Events

Internal Wake-Up Events	Source Module	PRCM Software Control	Wake-Up Event	Interrupt/Type	Interrupt to
IVA2, CORE, DSS, and PER domain dependency	PRCM	PM_WKDEP_MPU	Yes	No	N/A

Device wakeup	PRCM	PM_WKEN_WKUP	Yes	No	N/A
GPTIMER1 wakeup	GPTIMER1	PM_WKEN_WKUP	Yes	No	N/A
GPIO1 wakeup	GPIO 1		Yes	No	N/A

NOTE: Some of the 32 I/O pins for the GPIO1 in the WKUP power domain are connected to the device I/O pad logic in the CORE power domain (VDD2) and to the reset to the device I/O pad logic in the WKUP power domain (VDD3). As a result, when the CORE power domain is off, the corresponding I/O pins of the GPIO1 cannot generate a wake-up event. For details, see [Chapter 24, General-Purpose Interface Module](#).

4.8.5 Sleep and Wake-Up Dependencies

4.8.5.1 Sleep Dependencies

The (clock activity) dependencies between power domains are implemented to manage their sleep and wake-up transitions to ensure stable operation of the device.

A power domain sleep transition is achieved when all its clock domains (that is, functional and interface) are gated. For the gating of a clock domain, the following conditions must be satisfied:

- All initiator modules in the clock domain are in standby mode, that is, they cannot initiate any new transitions.
- All target modules in the clock domain are in idle mode and have no pending transitions.
- If the power domain depends on another power domain (that is, has a sleep dependency), the clock domains of the other power domain must be muted.

A clock domain is said to be muted when all its public initiator modules (that is, the initiator modules of the clock domain that can generate interconnect transactions towards targets outside the clock domain) are in standby mode, and the domain cannot initiate new interconnect transactions toward other domains.

Table 4-71 describes the mute conditions for the clock domains.

Table 4-71. Clock Domain Mute Conditions

Clock Domain Name	Clock Domain Composition	Mute Conditions
MPU	MPU power domain and MPU INTC in CORE power domain	MPU in stand-by, MPU INTC idle
IVA2	IVA2 power domain and WUGEN in CORE power domain	IVA2.2 in stand-by, WUGEN idle
SGX	SGX power domain	SGX in stand-by
CAM	CAM power domain	CAM in stand-by
DSS	DSS power domain	DSS in stand-by
PER	PER power domain	N/A (No public Initiator)
CORE_L3	L3 interconnect, L3 targets/initiators in CORE power domain	sDMA in standby
CORE_L4	L4 interconnect, L4 targets in CORE power domain	N/A (No public Initiator)
USBHOST	USBHOST power domain	USBHOST in stand-by
WKUP	WKUP power domain	N/A (No public Initiator)

A sleep dependency prevents the PRCM module from gating the clocks to a power domain (for sleep transition to inactive, retention, or off state from on state) if a dependent power domain is active (its clocks are active). A power domain can depend on several other power domains.

A power domain sleep dependency is programmed by setting the PRCM.CM_SLEEPDEP_<domain> register.

Example:

The PER domain has a programmable sleep dependency with the MPU and IVA2 power domains, and a hardwired sleep dependency with the CORE power domain. Therefore, if all software dependencies are enabled, the PER domain can go to idle mode only if the MPU, IVA2, and CORE-L3 clock domains are idle. If all software dependencies are disabled, the PER domain can go to idle mode, provided that the CORE-L3 clock domain is muted (no access to the PER domain can be pending).

Table 4-72 summarizes the programmable and hardwired sleep dependencies among the domains.

NOTE: The first row of the table identifies the dependent power domains for a power domain listed in the first column. Therefore, to identify the sleep dependency of power domain X, identify domain X in the first column, then follow its row to its sleep dependency with another power domain (identified in the top row).

Table 4-72. Sleep Dependencies

Power Domain	Clock Domain	Sleep Dependency											
		MPU	NEON	IVA2	SGX	CAM	DSS	PER	CORE_L3	CORE_L4	CORE_CM	USB_HOST	WKUP

Notes:

No software control (hardwired values):	0	Does not depend on
	1	Depends on
Software controllable	RW	Read and write
	n/a	Not applicable

4.8.5.2 Wake-Up Dependencies

A wake-up dependency allows a power domain to wake up (from off, retention or inactive state to on state) when another power domain wakes up (from off, retention or inactive state to on state). For example, power domain one (PD1) provides a service to power domain two (PD2), which creates a dependency between the two domains. When the dependent power domain (PD2) wakes up, it signals PD1 with a broadcasted wake-up event, causing PD1 to wake up.

A broadcasted wake-up event can originate from one of two sources:

- PD2 internal wake-up event (typically, a peripheral wake-up event)
- Abortion of the mute mode (at least one initiator in the domain exits standby mode) of PD2 when both the sleep dependency and wake-up dependency with PD1 are enabled.

NOTE: The domain wake-up dependency is a non-transitive property.

If a power domain PD1 has wake-up dependency with power domain PD2, i.e., PRCM.PM_WKDEP_PD1.EN_PD2 bit is set to 1 and if PD2 has wake-up dependency with power domain PD3, i.e., PRCM.PM_WKDEP_PD2.EN_PD3 bit is set to 1.

However, if PD1 does not have a direct wake-up dependency with PD3, i.e., PRCM.PM_WKDEP_PD1.EN_PD3 bit is set to 0. Then if the PD1 and PD2 are in inactive/retention or off power state and PD3 is inactive and is woken-up by a wake-up event, the PD2 is also woken-up but not the PD1.

Because a power domain can depend on several other power domains, it can broadcast the wake-up signal to each power domain on which it depends.

A power domain wake-up dependency can either be hardwired (set in the hardware) or programmable through software by configuring the PM_WKDEP_<domain> register for that power domain. Continuing the example of PD2 as dependent on PD1, setting the PM_WKDEP_PD1.PD2 bit means that when PD2 wakes up, PD1 also wakes up.

The MPU power domain can be wakened only by the IVA2, DSS, USBHOST, PER, CORE-L3, CORE-L4, and WKUP power domains. Similarly, the IVA2 power domain can be wakened only by the MPU, DSS, USBHOST, PER, CORE-L3, CORE-L4, and WKUP power domains. All wake-up dependencies of the MPU and the IVA2 power domain are software-configurable.

For the processor power domains (MPU and the IVA2 power domain), when the wake-up dependency with other power domains is software-programmable (that is, with the USBHOST, PER, CORE, and WKUP power domains), two registers may need be configured: PM_WKDEP_<domain> and PM_<processor>GROUPSEL_<domain>.

The PM_WKDEP_<domain> register serves only to enable/disable the global wake-up dependency of the processor power domain on these three power domains. The PM_<processor>GROUPSEL_<domain> register must be configured to enable the particular wake-up event in these domains that will wake up the processor domain. Thus, the global wake-up dependency for a dependent domain must be enabled so that a wake-up event can occur, if it has been enabled in the corresponding GROUPSEL register.

For example, if the wake-up dependency of the MPU power domain is to be enabled for a wake-up event from the GPIO2 module of the PER power domain, the following configuration is required:

- PRCM.PM_MPUGRPSEL_PER[13] GRPSEL_GPIO2
- PRCM.PM_WKDEP_MPU[7] EN_PER

[Table 4-73](#) summarizes the programmable and hardwired wake-up dependencies among the domains.

Table 4-73. Wake-Up Dependencies

4.8.6 USBHOST/USBTLL Save-and-Restore Management

Both USBHOST and USBTLL support a save-and-restore mechanism. When the device enters into off mode (that is, all power domains, except the WKUP power domain, are off), the user may want to save the USBHOST context and restore it when exiting off mode. The save-and-restore mechanism for the HS USB Host is enabled by setting the PRCM.PM_PWSTCTRL_USBHOST[4] SAVEANDRESTORE bit; for the USBTLL, it is configured by the PRCM.PM_PWSTCTRL_CORE[4] SAVEANDRESTORE bit. The save mechanism is initiated as the power domain transitions from active to off state (or to OSWR state for the USBTLL), whereas the restore mechanism is initiated as the power domain transitions from off to active power state.

Figure 4-72 shows the generic save-and-restore sequence applicable to both the USBHOST and the USBTLL. The sequence follows:

1. When the PRCM module intends to initiate a sleep transition over the power domain (the USBHOST power domain for the HS USB Host subsystem and the CORE power domain for the USBTLL module), it sends a sleep request to the power domain. When the domain modules acknowledge the sleep request, the functional and interface clocks to the modules are gated.
2. The PRCM module enables the SAR_FCLK functional clock and initiates the save sequence for the module. SAR_FCLK is gated when the save sequence completes.
3. The PRCM module switches the power domain state to off power state. When a wake-up event occurs, the PRCM module switches on the power domain.
4. The power domain local reset is asserted and then released by the reset manager.
5. The PRCM module enables the SAR_FCLK functional clock, and then initiates the restore sequence for the module. SAR_FCLK is gated when the restore sequence completes.
6. The PRCM module enables the functional and interface clocks to the modules and releases the sleep request. The modules acknowledge, and the wake-up sequence completes.

NOTE: The PRCM sleep request and the module acknowledge signals are part of a hardware communication interface to ensure the correct sleep and wake-up sequence.

Figure 4-72 shows the save-and-restore sequence. It does not provide the exact timing delays between the switching of the signals and serves only to highlight the sequence of events.

Figure 4-72. Save-and-Restore Sequence

prcm-092

4.8.6.1 USBHOST SAR Sequences

4.8.6.1.1 Save Sequence on Sleep Transition

A precondition to the save sequence on sleep transition is that the save-and-restore mechanism is enabled (the PRCM.PM_PWSTCTRL_USBHOST[4] SAVEANDRESTORE bit is set to 1). The sequence is initiated when the power domain switches from ON to OFF power state.

1. The PRCM module activates USBHOST_SAR_FCLK and starts the save sequence.
2. When the USBHOST power domain is idled (all clocks of the power domain are gated), the PRM initiates the power domain transition to OFF power state by setting the PRCM.PM_PWSTCTRL_USBHOST[1:0] POWERSTATE bit field to 0x0.
3. When the save sequence completes, USBHOST_SAR_FCLK is gated.
4. The power domain sleep transition to OFF power state completes.

4.8.6.1.2 Restore Sequence on Wake-Up Transition

A precondition to the restore sequence on wake-up transition is that the save-and-restore mechanism is enabled (the PRCM.PM_PWSTCTRL_USBHOST[4] SAVEANDRESTORE bit is set to 1). The sequence is initiated when the power domain switches from off to on power state.

1. The PRCM switches the power domain to ON power state.
2. The PRCM asserts the USBHOST domain reset. The functional reset is released locally when the functional clocks are back.
3. The PRCM releases the USBHOST domain reset.
4. The PRCM module activates USBHOST_SAR_FCLK and starts the restore sequence.
5. When the restore sequence completes, USBHOST_SAR_FCLK is gated.
6. The power domain wake-up transition to ON power state completes.

4.8.6.2 USB TLL SAR Sequences

4.8.6.2.1 Save Sequence on Sleep Transition

A precondition to the save sequence on sleep transition is that the save-and-restore mechanism is enabled (the PRCM.PM_PWSTCTRL_CORE[4] SAVEANDRESTORE bit is set to 1). The sequence is initiated when the power domain switches from ON to Open Switch Retention (OSWR) or OFF power state.

1. When the CORE power domain is idled (all clocks of the power domain are gated), the PRM initiates the power domain transition to OFF or OSWR power state by setting the PRCM.PM_PWSTCTRL_CORE[1:0] POWERSTATE bit field to 0x0 or 0x1.
2. The PRCM module activates USBTTL_SAR_FCLK and starts the save sequence.
3. When the save sequence completes, USBTTL_SAR_FCLK is gated.
4. The power domain sleep transition to OFF or OSWR power state completes.

4.8.6.2.2 Restore Sequence on Wake-Up Transition

A precondition to the restore sequence on wake-up transition is that the save-and-restore mechanism is enabled (the PRCM.PM_PWSTCTRL_CORE[4] SAVEANDRESTORE bit is set to 1). The sequence is initiated when the power domain switches from OFF or OSWR to ON power state.

1. PRCM switches the power domain to ON power state.
2. Assert CORE domain reset (must override the functional stall conditions of the reset manager). The functional reset is released locally when the functional clocks are back.
3. Release CORE domain reset.
4. The PRCM module activates the USBTTL_SAR_FCLK and starts the restore sequence.
5. When the restore sequence completes, USBTTL_SAR_FCLK is gated.
6. The power domain wake-up transition to ON power state completes.

4.9 PRCM Interrupts

Table 4-74 lists the interrupts from the PRCM module to the MPU and the IVA2.

Table 4-74. Interrupt Descriptions

Interrupt Name	Mapping	Description
PRCM_MPU_IRQ	M_IRQ_11	To MPU interrupt controller (MPU INTC)
PRCM_IVA_IRQ	IVA2_IRQ[12]	To IVA2.2 wake-up controller (IVA2.2 WUGEN)

Table 4-75 and Table 4-76 summarize the event flags (in [PRM_IRQSTATUS_MPU](#) and [PRM_IRQSTATUS_IVA2](#) registers) and mask (in [PRM_IRQENABLE_MPU](#) and [PRM_IRQENABLE_IVA2](#) registers) related to the events generating PRCM interrupts to the MPU and the IVA2.

Table 4-75. MPU Interrupt Event Descriptions

Event Flag	Event Mask	Map to	Automatic MPU Domain Wake-Up Event	Description
PRM_IRQSTATUS_MPU[0] WKUP_ST	PRM_IRQENABLE_MPU[0] WKUP_EN	PRCM_MPU_IRQ	No	MPU peripheral group wakeup
PRM_IRQSTATUS_MPU[2] EVGENON_ST	PRM_IRQENABLE_MPU[2] EVGENON_EN	PRCM_MPU_IRQ	No	Event generator end of on time
PRM_IRQSTATUS_MPU[3] EVGENOFF_ST	PRM_IRQENABLE_MPU[3] EVGENOFF_EN	PRCM_MPU_IRQ	No	Event generator end of off time
PRM_IRQSTATUS_MPU[4] TRANSITION_ST	PRM_IRQENABLE_MPU[4] TRANSITION_EN	PRCM_MPU_IRQ	No	A sleep or wake-up transition completion event for IVA2, NEON, SGX, DSS, CAM, PER, EMU, USBHOST power domains
PRM_IRQSTATUS_MPU[5] CORE_DPLL_ST	PRM_IRQENABLE_MPU[5] CORE_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL3 recalibration event
PRM_IRQSTATUS_MPU[6] PERIPH_DPLL_ST	PRM_IRQENABLE_MPU[6] PERIPH_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL4 recalibration event
PRM_IRQSTATUS_MPU[7] MPU_DPLL_ST	PRM_IRQENABLE_MPU[7] MPU_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL2 recalibration event
PRM_IRQSTATUS_MPU[8] IVA2_DPLL_ST	PRM_IRQENABLE_MPU[8] IVA2_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL1 recalibration event
PRM_IRQSTATUS_MPU[9] IO_ST	PRM_IRQENABLE_MPU[9] IO_EN	PRCM_MPU_IRQ	No	I/O pads wake-up event
PRM_IRQSTATUS_MPU[22] VC_SAERR_ST	PRM_IRQENABLE_MPU[22] VC_SAERR_EN	PRCM_MPU_IRQ	Yes	Slave address in an I ² C frame sent by the voltage controller not acknowledged by the power IC device
PRM_IRQSTATUS_MPU[23] VC_RAERR_ST	PRM_IRQENABLE_MPU[23] VC_RAERR_EN	PRCM_MPU_IRQ	Yes	Register address in an I ² C frame sent by the voltage controller not acknowledged by the power IC device
PRM_IRQSTATUS_MPU[24] VC_TIMEOUTERR_ST	PRM_IRQENABLE_MPU[24] VC_TIMEOUTERR_EN	PRCM_MPU_IRQ	Yes	Last byte of an I ² C frame issued from the bypass port or from the voltage manager FSM ports sent by the voltage controller not acknowledged by the power IC device
PRM_IRQSTATUS_MPU[25] SND_PERIPH_DPLL_RECAL_ST	PRM_IRQENABLE_MPU[25] SND_PERIPH_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL5 recalibration event

Table 4-76. IVA2 Interrupt Event Descriptions

Event Flag	Event Mask	Map to	IVA2 Domain Wake-Up Event	Description
PRM_IRQSTATUS_IVA2[0] WKUP_ST	PRM_IRQENABLE_IVA2[0] WKUP_EN	PRCM_IVA_IRQ	No	IVA2 peripheral group wakeup
PRM_IRQSTATUS_IVA2[1] FORCEWKUP_ST	PRM_IRQENABLE_IVA2[1] FORCEWKUP_EN	PRCM_IVA_IRQ	No	IVA2 power domain forced wake-up transition completion
PRM_IRQSTATUS_IVA2[2] IVA2_DPLL_ST	PRM_IRQENABLE_IVA2[2] IVA2_DPLL_RECAL_EN	PRCM_IVA_IRQ	Yes	DPLL2 recalibration required

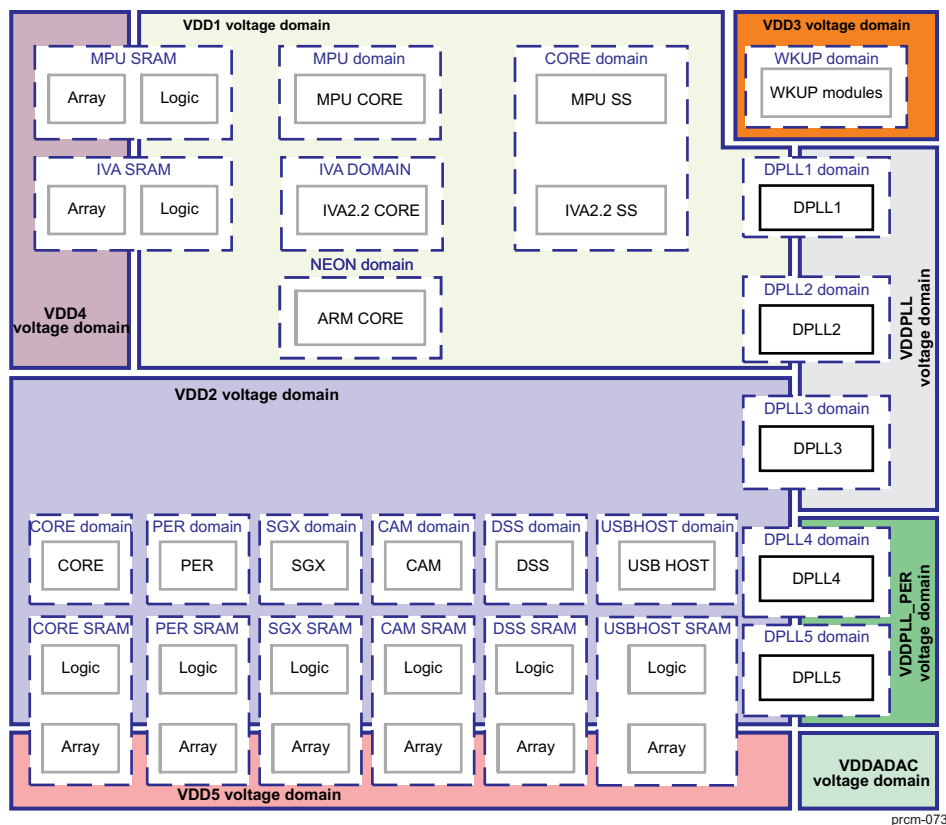

NOTE: The software must first read the event flag to determine the cause of the interrupt and then write 1 to it to clear the flag.

4.10 PRCM Voltage Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

4.10.1 Overview

Figure 4-73 is an overview of the device voltage domains.

Figure 4-73. Overview of Device Voltage Domains

The device is split into voltage domains:

- Three voltage domains for logic (VDD1, VDD2, and VDD3)
- Two voltage domains for memory (VDD4 and VDD5)
- Two voltage domains for PLLs and analog cells (VDDPLL and VDDPLL_PER)
- Voltage domain for the I/Os

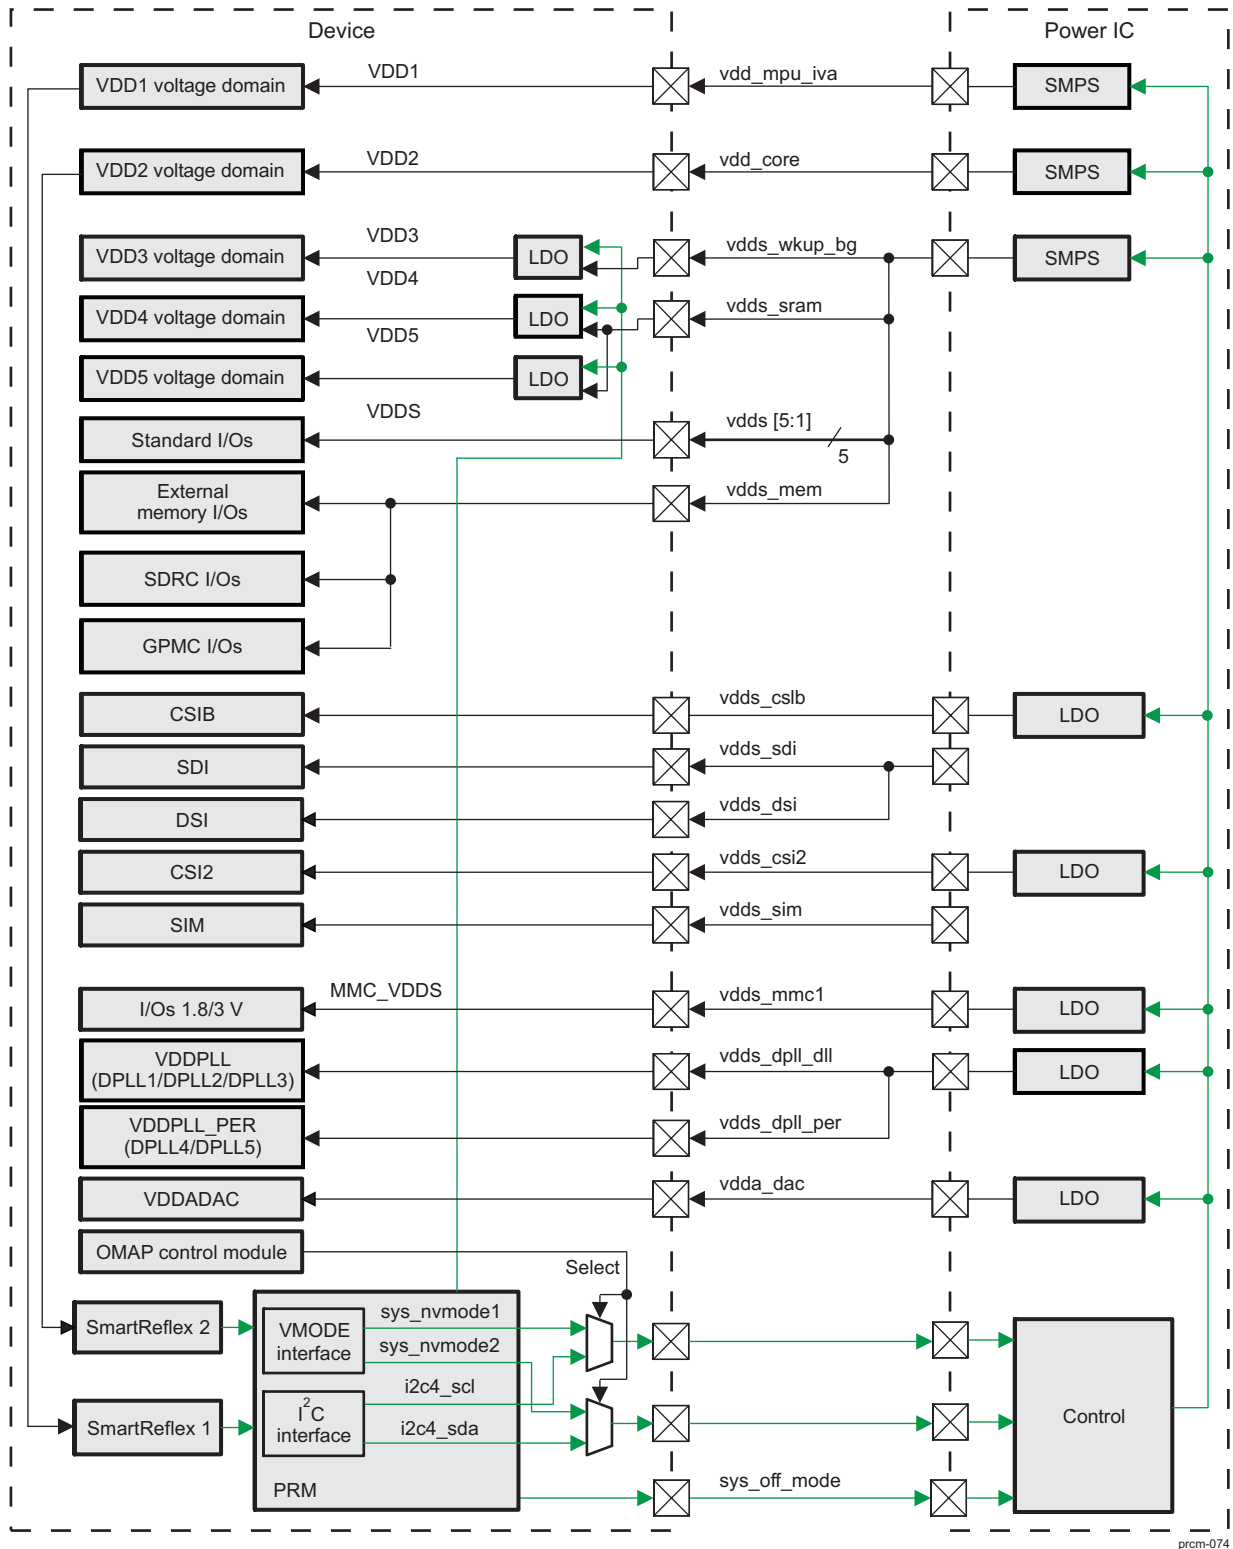

This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated SMPS or LDO. Functionally, however, voltage control of a voltage domain may depend on the voltage level of another voltage domain; for example, VDD1 voltage-level control may depend on the VDD2 voltage level. [Figure 4-73](#) shows the voltage dependency between domains.

[Figure 4-74](#) is an overview of the device voltage sources and their controls. The PRM directly manages the following voltage sources:

- VDD1: Processor voltage
- VDD2: CORE voltage
- VDD3: Wake-up voltage
- VDD4: Processor SRAM voltage
- VDD5: CORE SRAM voltage

The remaining voltage sources (VDDS, VDDPLL, and MMC-VDDS) are either controlled directly by the external device or software-controlled through an I²C interface independent of the PRM. [Figure 4-74](#) is an overview of PRCM voltage control.

Figure 4-74. Overview of Device Voltage Distribution

prcm-074

NOTE: Memory I/Os (1.8 V) are not supplied with the other I/Os. They come directly from the power IC.

4.10.2 Voltage Domains

Table 4-77 summarizes, for each voltage domain, the voltage level corresponding to its OPP when its power domains are on and the voltage level when its power domains are in retention or off power state. The exact values depend on the silicon; for details, see the data manual performance addendum.

Table 4-77. Voltage Domain Controls Summary

Voltage Domain (Power Rail)	Operating Point	Control	Supplied Modules
VDD1 voltage domain (vdd_mpu_iva)	Off	HW and SW	MPU subsystem, IVA2.2 subsystem, digital part of DPLL1 and DPLL2
	Retention		
	OPP1		
	OPP2		
	OPP3		
	OPP4		
	OPP5		
VDD2 voltage domain (vdd_core)	Off	HW and SW	Most modules, interconnects, peripherals. digital part of DPLL3, DPLL4, and DPLL5
	Retention		
	OPP1		
	OPP2		
	OPP3		
VDD3 voltage domain (vdds_wkup_bg)	Low-power mode	HW	WKUP and EMU domains
	Normal mode		
	Emulation mode		
VDD4 voltage domain (vdds_sram)	All memories off	HW	Processor memories
	All memories in retention		
	VDD1 is in OPP1, OPP2, or OPP3		
	VDD1 in OPP4 or OPP5		
VDD5 voltage domain (vdds_sram)	Off	HW	CORE, SGX, CAM, DSS, PER, USBHOST, and EMU memories
	Retention		
	VDD2 is in OPP1, OPP2, or OPP3		
VDDS voltage domain (vdds)	Always-on	None	I/Os
VDDADAC voltage domain (vdda_dac)	Software-driven only ⁽¹⁾	SW	Video DAC
VDDPLL voltage domain (vdds_dpll_dll)	Always-on ⁽¹⁾	None	Analog part of DPLL1, DPLL2, and DPLL3
VDDPLL_PER voltage domain (vdds_dpll_per)	Always-on ⁽¹⁾	None	Analog part of DPLL4 and DPLL5
External memory I/Os (vdds_mem)	Always-on ⁽¹⁾	None	External memory, SDRC, and GPMC I/Os
CSIB (vdds_csib)	Always-on ⁽¹⁾	None	CSIB balls
SDI (vdds_sdi)	Always-on ⁽¹⁾	None	SDI balls
DSI (vdds_dsi)	Always-on ⁽¹⁾	None	DSI balls
CSI2 (vdds_csi2)	Always-on ⁽¹⁾	None	CSI2 balls
SIM (vdds_sim)	Always-on ⁽¹⁾	None	SIM

⁽¹⁾ Identifies voltage domains that can be switched to 0.0 V when the interface/module is not in use.

Table 4-77. Voltage Domain Controls Summary (continued)

Voltage Domain (Power Rail)	Operating Point	Control	Supplied Modules
MMC_VDDS voltage domain (vdds_mmc1)	Always-on ⁽¹⁾	None	MMC1

NOTE:

- Logic retention (RFFs and some memory registers OSWR) is implemented only for parts of the CORE power domain. Full device logic retention is also feasible by keeping all power domains on and lowering VDD1 and VDD2 to minimum OPP (CSWR). This consumes more power than the first option, but allows for a fast restart.
- When the user programs all memories in retention, VDD4 and VDD5 are automatically set to RETENTION voltage level by the PRM, which allows the memory arrays to be retained.

4.10.3 Voltage Domain Dependencies

Table 4-78 and Table 4-79 summarize the hardware conditions and the software setting required to switch the VDD1 and VDD2 to their respective low-power states.

Table 4-78. VDD1 Voltage Domain Dependencies

VDD1 Domain State	Power Domains State	DPLL State	sys_clk	Software Control ⁽¹⁾	VDD2	VDD3	VDD4	VDD5
SLEEP	Software controlled power domains of VDD1 are in inactive, retention, or off state.	DPLL1 and DPLL2 are in Stop mode.	N/A	AUTO_SLEE P = 1 AUTO_RET = 0 AUTO_OFF = 0	ON or SLEEP	ON or Overdriven	ON or retention	ON or retention
Retenti on	Software controlled power domains of VDD1 are in retention or off state and of VDD2 are in INACTIVE, retention or off state.	DPLL1 and DPLL2 are in Stop mode.	N/A	AUTO_SLEE P = 0 AUTO_RET = 1 AUTO_OFF = 0	ON or retention	ON or Overdriven	Retention	ON or retention
Off	Software controllable power domains of VDD1 and VDD2 are in off state.	All DPLLs are in Stop mode.	No longer required	AUTO_SLEE P = 0 AUTO_RET = 0	Off	SLEEP	Off	Off

⁽¹⁾ It is mandatory to program the AUTO_SLEEP, AUTO_RET, and AUTO_OFF bit fields in an exclusive manner.

Table 4-78. VDD1 Voltage Domain Dependencies (continued)

VDD1 Domain State	Power Domains State	DPLL State	sys_clk	Software Control ⁽¹⁾	VDD2	VDD3	VDD4	VDD5
				AUTO_OFF = 1				

Table 4-79. VDD2 Voltage Domain Dependencies

VDD2 Domain State	Power Domains State	DPLL State	sys_clk	Software Control ⁽¹⁾	VDD1	VDD3	VDD4	VDD5
SLEEP	Software controlled power domains of VDD1 and VDD2 are in inactive, retention or off state.	All DPLLs are in Stop mode.	No longer required	AUTO_SLEEP P = 1 AUTO_RET = 0 AUTO_OFF = 0	SLEEP	ON or Overdriven	ON or retention	ON or retention
Retention	Software controlled power domains of VDD1 are in inactive, retention or off state and of VDD2 are in retention or off state.	All DPLLs are in Stop mode.	No longer required	AUTO_SLEEP P = 0 AUTO_RET = 1 AUTO_OFF = 0	ON or retention	ON or Overdriven	ON or retention	Retention
Off	Software controllable power domains of VDD1 and VDD2 are in off state.	All DPLLs are in Stop mode.	No longer required	AUTO_SLEEP P = 0 AUTO_RET = 0 AUTO_OFF = 1	Off	SLEEP	Off	Off

⁽¹⁾ It is mandatory to program the AUTO_SLEEP, AUTO_RET, and AUTO_OFF bit fields in an exclusive manner.

NOTE:

- In voltage domain SLEEP state, the current load decreases because of reduced activity level; however, the voltage level remains that of on state.
- In voltage domain overdriven state, the domain voltage is raised above the nominal operating voltage to boost performance; however, power consumption also increases.
- AUTO_SLEEP, AUTO_RET and AUTO_OFF, in the Software Control column, refer to the [PRM_VOLTCTRL\[0\]](#) AUTO_SLEEP, [PRM_VOLTCTRL\[1\]](#) AUTO_RET and [PRM_VOLTCTRL\[2\]](#) AUTO_OFF bits.

Table 4-80. Remaining Voltage Domain Dependencies

Voltage	Condition
VDDS	No dependency with other device voltages
External memory I/Os	
VDDADAC	
VDDPLL	
VDDPLL_PER	
CSIB	
SDI	
DSI	
CSI2	
SIM	
MMC_VDDS	

4.10.4 Voltage-Control Architecture

The PRM is split over several blocks that manage the different voltage sources.

- VDD1 and VDD2 voltages are managed by multiple control sources:
 - Direct software control of VDD1 and VDD2 is also possible by writing to the registers of the voltage controller, which then sends the voltage commands to the power IC through the dedicated I²C interface.
 - Two voltage finite state-machines (FSM 1 and FSM 2) can also manage the VDD1 and VDD2 voltages either by sending commands to the voltage controller (I²C mode) or by sending the sys_nvmode1 and sys_nvmode2 control signals (direct-control mode). The FSMs control voltage-level switching, based on the power state of the device.
- The FSMs in the PRM also control SRAM and wake-up LDOs, sleep mode for analog cells, and level shifters.
- A device FSM sequences the memory, wakeup, voltage, and I/O FSMs during the device off, sleep, and wake-up transitions.

Figure 4-75 shows the architecture for PRM voltage control.

Figure 4-75. PRM Voltage Control Architecture

* The green region in the figure represents the boundary of the PRM

prcm_swpu114-075

CAUTION

It is highly recommended to use the embedded dedicated I2C4 instead of VMODE, which is a legacy mode. The I2C4 provides greater flexibility and higher efficiency in terms of power optimization.

4.10.5 VDD1 and VDD2 Control

The main power-supply sources, VDD1 and VDD2, can be controlled using mutually exclusive modes specified in the SCM:

- Direct control with VMODE signals or I2C interface
- Dedicated I²C control

Because both control modes are multiplexed on the same device pins, direct control signals can be used alternately with I²C control signals. The muxes are managed by the SCM.

4.10.5.1 Direct Control With VMODE Signals

In direct-control mode, the VDD1 and VDD2 voltage sources can be controlled by the voltage FSMs in the PRM to trigger a voltage transition based on the power domain states. The voltage FSMs use a VMODE interface to send voltage commands through the `sys_nvmode1` and `sys_nvmode2` pins of the device to the external power IC. The simple voltage-control commands of the VMODE interface can be used to set two voltage values (VDD1 and VDD2) per voltage domain .

The `sys_nvmode[1,2]` signals request new voltage levels to the external SMPS. The polarity of the `sys_nvmode[1,2]` signals from the PRM is configured by the `PRM.PRM_POLCTRL[0]` `EXTVOL_POL` bit, which is active-low by default. When the signal goes low, a lower voltage is supplied, and when it goes high, a higher voltage is supplied.

The VMODE voltage control is enabled by setting the `PRM.PRM_VOLTCTRL[4]` `SEL_VMODE` bit, and is triggered when the device switches between low-power (retention or off) mode and normal (on) mode.

Figure 4-76 is an example of a VDD2 voltage transition from an operational voltage at 1.15 V (OPP3) to the lowest functional voltage of the device (0.9 V). In this example, the PRCM module is programmed to automatically lower `sys_nvmode2` when the device enters sleep mode. The power IC is programmed to ramp the VDD2 voltage down to 0.9 V when `sys_nvmode2` is deasserted and to ramp up the voltage to 1.15 V when `sys_nvmode2` is asserted. The PRCM module must also wait for the VDD2 regulator to stabilize when `sys_nvmode2` is deasserted and asserted. This stabilization time is programmable by software using the `PRM.PRM_VOLTSETUP1` register.

Figure 4-76. Voltage Transition Controlled by `sys_nvmode2`

prcm-076

Internally, the PRM manipulates two logical voltage levels (L0 and L1) for each `sys_nvmode[1,2]` signal. One level is set when all the power domains in the voltage domain are in retention or off mode, while the other is set when a power domain is on. The power IC must be configured to switch to low voltage when the associated `sys_nvmode[1,2]` signal is received, and vice versa.

For example, if L0 is the lower voltage and an active-low polarity (default setting) on the `sys_nvmode[1,2]` signal:

- L0 logical level `sys_nvmode[1,2] = 1` VDD = 1.15 V
- L1 logical level `sys_nvmode[1,2] = 0` VDD = 0.9 V

The polarity of the logical voltage-level signal from the PRM can be controlled by the `PRM.PRM_POLCTRL[0]` `EXTVOL_POL` bit. It is active-low by default (L0 = 1, L1 = 0).

4.10.5.2 Direct Voltage Control With I²C Interface

PRM can send VDD1 and VDD2 sleep commands to the power IC through the dedicated I²C. This allows the power IC to activate sleep mode (the voltage regulator switches in sleep mode, where voltage is maintained but only small load is supported). This also allows external power IC to reduce its power consumption.

4.10.5.3 Voltage Controller and Dedicated I²C Interface

The central modules for the I²C control mode are the voltage controller and the I²C interface. The voltage controller receives voltage control commands from input ports:

- Voltage FSM 1 and 2 ports: The voltage FSMs send commands to the voltage controller when the device enters retention or off power state, and also when the device wakes up.
- PRM register port: The PRM registers give direct software control over the voltage levels of the VDD1 and VDD2 voltage domains.

An arbitration scheme in the voltage controller manages concurrent requests on multiple ports.

Externally, the voltage controller interfaces to a power IC through a dedicated I²C interface (I2C4). To reduce the latency of voltage changes, the voltage controller is configurable to run in HS I²C mode.

Each internal port has a handshake to indicate when the I²C frame that results from the request on that port is acknowledged by the external power IC.

4.10.6 Analog Cells, LDOs, and Level Shifter Controls

In addition to the VDD1 and VDD2 voltage controls, the PRM handles the following operations automatically, based on hardware conditions, without any software control:

- Reduces SRAM LDOs voltage when all memories are in retention
- Reduces wake-up LDO voltage when the device enters off mode (wake-up leakage reduction)
- Increases wake-up LDO voltage when emulation trace is active
- Actively isolates level shifters during VDD1 and VDD2 removal
- Activates sleep mode in all analog cells when the device enters off mode

4.10.6.1 SRAM Voltage Control

The two embedded SRAM LDOs supply regulated voltage (VDD4 or VDD5) to memory banks. The processor memory LDO (VDD4) has three reference voltages, while the CORE memory LDO (VDD5) supports two:

- 1.2 V is the normal voltage reference, used for processors OPP1, OPP2, and OPP3.
- Tracking between 1.2 V and 1.35 V: The processor SRAM LDO (VDD4) tracks and follows VDD1 voltage when it exceeds OPP3 (1.2 V) nominal voltage. VDD1 (up to 1.35 V) is the overdrive voltage reference when processors operate at OPP4 and OPP5. This option is not supported by the LDO (VDD5) of the CORE memory.
- 1.0 V is set when all memory banks belonging to the LDO are in retention state. This allows reducing the memory arrays to 0.6 V to minimize leakage.

When not used (all memories are off), the LDO is shut down. These modes are managed automatically by hardware (PRM).

4.10.6.2 Wake-Up and Emulation Voltage Control

The embedded wake-up LDO (VDD3) supplies both WKUP and EMU power domains. It is permanently active and feeds the WKUP power domain continuously. An embedded switch allows the PRM to control power to the EMU power domain. This switch is closed on a software request command when a debug session starts, or automatically on JTAG plug detection.

This LDO has three reference voltages:

- 1.2 V is the normal voltage reference, used in device active mode.
- 1.35 V is the overdrive voltage reference used when emulation is activated and MPU emulation trace is required.
- 1.0 V is set when the device is in low-power (off) mode, to minimize leakage.

These modes are managed automatically by hardware.

4.11 PRCM Off-Mode Management

4.11.1 Overview

The CORE power domain can be switched from ON to OFF or retention state.

When the CORE power domain is inactive, the clock manager does not generate an interface clock, and device interconnects are inactive; therefore, the device is effectively in off mode. In retention state, however, the logic in the CORE domain is retained, and the device wake-up latency is small compared to the latency when the CORE power domain is in off state. In waking from the CORE domain off state, the CORE logic configuration must be loaded from a scratchpad memory in the WKUP power domain.

NOTE: Although some modules in the device can be kept active while the CORE power domain is off or in retention, this is not recommended.

When the device is put in off mode (the CORE power domain is in retention or off state), the device voltage domains can be switched off to minimize leakage currents. However, reactivity to wake-up events must be ensured.

The device supports a unique off-mode management scheme that allows deactivation of all modules, isolation of their outputs, and configuration of a dedicated off mode on the I/O pads of the device, to listen to wake-up events. A wake-up event on any I/O pad is detected by the PRM (in WKUP always-on power domain), which can then wake up the device.

4.11.2 Device Off-Mode Configuration

4.11.2.1 Overview

Any I/O pad of the device can be configured to generate a wake-up event when the device is in off mode. The off-mode scheme is based on the following components of the device:

- I/O pads
- SCM

[Figure 4-77](#) is an overview of the I/O pad off-mode scheme. In this mode, the I/O pads of the device form a daisy chain. The I/O pad logic at the two ends of the chain is connected to the PRM.

When a wake-up event (WUEVT) occurs on an enabled I/O pad in the chain, the event is propagated through the chain to the PRM. Multiple I/O pads can receive a wake-up event simultaneously; however, the PRM receives only the OR output for all the enabled I/O pads. When the device wakes up, the MPU can determine all sources of the current wake-up event logged into the corresponding CONTROL.CONTROL_PADCONF_<IOPad>[15] WAKEUPEVENT0 or CONTROL.CONTROL_PADCONF_<IOPad>[31] WAKEUPEVENT1 bit in the SCM.

The I/O pad wake-up scheme must be enabled globally by setting the PRCM.PM_WKEN_WKUP[8] EN_IO bit and the PRCM.PM_WKEN_WKUP[16] EN_IO_CHAIN bit. The wake-up event from each I/O pad of the device can be individually enabled/disabled (EVT_EN signal) by writing to the CONTROL.CONTROL_PADCONF_<IOPad>[14] WAKEUPENABLE0 or CONTROL.CONTROL_PADCONF_<IOPad>[30] WAKEUPENABLE1 bit in the SCM.

For information about the SCM, see [Chapter 7, System Control Module](#).

NOTE: As explained previously (see [Section 4.8, Idle and Wake-Up Management](#)), module-specific wake-up events other than the I/O pad wake-up scheme can wake up the device from off mode. For example, the GPIO pads in the WKUP power domain can also wake up the device.

NOTE: For the wake-up features of the GPIO pads, see [Chapter 24, General-Purpose Interface](#).

Figure 4-77. Device Off-Mode Control Overview

4.11.2.2 I/O Wake-Up Mechanism

There are two ways to capture an I/O event. The expected way is to use GPIO modules. However, these modules may be powered-off when there is a need to capture an I/O event. The second way to capture an I/O event is through an I/O wake-up scheme controlled by the I/O daisy chain.

Only one GPIO module is in the WKUP domain, which is not switchable, and the other GPIO modules are in the PER domain, which is switchable. Therefore, the I/O wake-up scheme for the corresponding I/O must be enabled before transitioning the PER domain to a nonfunctional state. This typically happens when the device is programmed to enter OFF state.

During off mode, only six pins of the GPIO module in the WAKEUP domain are wake-up capable; therefore, the I/O wake-up scheme must be enabled for the other 26 I/Os before transitioning to OFF state.

The I/O wake-up scheme can be enabled when the PER domain is in ACTIVE state.

Software must enable and disable the I/O wake-up scheme and ensure an overlap window between the GPIO wake-up capability and the I/O wake-up capability. Software must manage this overlap window.

The I/O wake-up scheme in each pad is enabled through the I/O daisy chain:

- The I/O wake-up capability is enabled by programming the corresponding register (CONTROL.CONTROL_PADCONF_X) in the control module.
- The global I/O wake-up enable bit is enabled by programming a dedicated register (PRCM.PM_WKEN_WKUP[8] EN_IO) in the PRCM module.
- The I/O wake-up scheme is enabled by triggering the I/O daisy chain control (Wu clock) by programming a dedicated register (PRCM.PM_WKEN_WKUP[16] EN_IO_CHAIN) in the PRCM module.

Software must wait for the I/O daisy chain to complete before it transitions the PER domain to a nonfunctional state. This is done by polling a dedicated status bit in the PRCM module (PRCM.PM_WKST_WKUP[16] ST_IO_CHAIN). This status bit must be cleared by software when the bit is read to 1.

The I/O wake-up scheme in each pad is disabled through the I/O daisy chain:

- The I/O wake-up scheme is disabled by programming the dedicated register (PRCM.PM_WKEN_WKUP[16] EN_IO_CHAIN) in the PRCM module.
- The global I/O wake-up enable bit is disabled by programming a dedicated register (PRCM.PM_WKEN_WKUP[8] EN_IO) in the PRCM module.
- The I/O wake-up scheme is disabled by triggering the I/O daisy chain control (Wu clock) by writing 1 in a dedicated register (PRCM.PM_WKST_WKUP[8] ST_IO) in the PRCM

This bit is also used to log the source of the I/O wakeup. Writing 1 in this register clears this bit to 0.

4.11.3 CORE Power Domain Off-Mode Sequences

The I/O pad wake-up scheme can be activated to detect wake-up events when the CORE power domain is switched to inactive, retention, or off state. The off state sequences for the CORE power domain include the sequence for going from on state to retention or off power state (while enabling the I/O pad wake-up scheme), and then switching back to the on power state (while disabling the I/O pad wake-up scheme) on an I/O wake-up event.

4.11.3.1 Sleep Sequences (Transition From On to Retention/Off)

When the CORE power domain is in retention state, the logic is switched off, its context is saved by the RFFs in the modules, and the memory blocks are retained. In off state, however, the logic and memories are switched off, and the RFFs are not saved.

NOTE: If the PER power domain is kept on while the CORE power domain is in retention state, all I/O wake-up enable (EVT_EN signals) signals to the I/O pads related to the PER power domain inputs must be disabled (by clearing the CONTROL.CONTROL_PADCONF_<IOpad>[14] WAKEUPENABLE bit in the SCM). In this case, wake-up events are generated by the PER domain and not through the daisy chain.

For information about the SCM, see [Chapter 7, System Control Module](#).

The following sequence is used to go from on to retention or off state:

1. The software sets the PRCM.PM_WKEN_WKUP[8] EN_IO bit and the PRCM.PM_WKEN_WKUP[16] EN_IO_CHAIN bit to enable the I/O pad wake-up scheme.
2. The MPU initiates the sleep sequence. When all conditions are met, the CORE power domain clocks are shut down. At this stage, most of the pads are inactive, but some, such as the PER and DSS power domains, can stay active.
3. The PRM initializes and resets the I/O wake-up detection scheme and saves all RFFs. Its CORE power domain output is isolated from the I/O pads.
4. The PRM switches the CORE power domain to retention/off power state. The I/O configuration is saved on wake-up power domain registers; see [Section 7.4.4.4.1, Save-and-Restore Mechanism](#), in [Chapter 7, System Control Module](#), for more information.
5. The PRM waits for a wake-up event from the daisy chain. Other possible wake-up sources can be a wake-up event from a module in the wake-up power domain or from a global warm reset.

NOTE: When the CORE power domain is in retention state, VDD2 voltage must be at retention or on voltage level to maintain stable CORE power domain output values to the I/Os.

4.11.3.2 Wake-Up Sequences (Transition From Retention/Off to On)

The PRM detects a wake-up event from the daisy chain. Several wake-up events can occur simultaneously, but PRM only sees the ORing of them. Depending on whether the CORE power domain is in retention or off state, the following sequence is followed to wake up the CORE and MPU power domains:

1. When the CORE power domain wakes up from off/retention power state, reset is asserted for both the MPU and the CORE power domains.
2. The MPU and the CORE power domains are switched to ON power state.
3. The domain clocks of the MPU and the CORE power domains are restarted.
4. If the CORE power domain was in the off power state, its reset is released before the MPU power domain.
 - The hardware restores the I/O pad configuration and some configuration registers of the control module. This configuration has been saved in the scratchpad memory (by the control module save procedure initiated by software control prior to the transition to off power state).
 - The PRCM module switches the I/O pad configurations to the normal restored configuration (The I/O pad isolation is released).
 - The reset is released for MPU power domain.
5. If the CORE power domain was in the retention power state, the reset is released for both the MPU and the CORE power domains at the same time.
6. When the MPU boots, the software accesses the SCM to read the wake-up event source (identified by the CONTROL.CONTROL_PADCONF_<IOpad>[15] WAKEUPEVENT bits in the SCM corresponding to all enabled pads).
7. The software disables the wake-up daisy chain by clearing the PRCM.PM_WKEN_WKUP[8] EN_IO bit and the PRCM.PM_WKEN_WKUP[16] EN_IO_CHAIN bit.

NOTE: A daisy-chain wake-up event always causes the MPU to restart and boot. Other independent wake-up events activated in off mode (for example, a GPIO wake-up event) always cause the CORE power domain to be activated. The MPU is wakened if a wake-up dependency has been set by the user, or if the modem generates an interrupt to the MPU.

4.11.4 Device Off-Mode Sequences

Device off-mode sequencing requires preliminary settings that can be done during device initialization. The following actions are performed once and remain valid for all device off/on transitions:

1. Configure valid off and active pad configuration for each pad by programming the SCM CONTROL.CONTROL_PADCONF_<IOpad> register.
2. Save the active pad configuration by asserting the CONTROL.CONTROL_PADCONF_OFF[1] STARTSAVE bit in the SCM. This process can be repeated each time the active pad configuration of the device is changed.
3. Set the SCM to smart-idle mode by configuring the CONTROL.CONTROL_SYSCONFIG[4:3] IDLEMODE bit field. This ensures that the module clocks remain active during the configuration save procedure.
4. Disable all the modules running on system clock or switch them on the 32 kHz clock when required.
5. Configure the voltage regulator setup times (the PRCM.PRM_VOLTSETUP1[15:0] SETUP_TIME1 and PRCM.PRM_VOLTSETUP1[31:16] SETUP_TIME2 bit fields).
6. Set sys_off_mode deassertion time in the PRCM.PRM_VOLTOFFSET[15:0] OFFSET_TIME bit field.
7. Configure the system clock oscillator setup time in the PRCM.PRM_CLKSETUP[15:0] SETUP_TIME bit field.

For information about the SCM, see [Chapter 7, System Control Module](#).

4.11.4.1 Sleep Sequences

The sleep sequences exemplify the two types of device transitions from ON to OFF mode:

- Device off-mode transition without using the SYS_OFF_MODE signal

- Device off-mode transition using only the SYS_OFF_MODE signal

4.11.4.1.1 Device Off-Mode Transition Without Using the SYS_OFF_MODE Signal

Each time the device enters I/O-pad-off configuration mode, the following sequence must be performed:

1. Software sets the PRCM.PM_WKEN_WKUP[8] EN_IO bit and the PRCM.PM_WKEN_WKUP[16] EN_IO_CHAIN bit to enable the I/O wake-up scheme.
2. The MPU initiates the sleep sequence. When all sleep conditions are met, all domain clocks are shut down. At this stage, all output pads are inactive and static.
3. The PRM configures the I/O daisy-chain for the wake-up detection scheme.
4. The CORE domain output is isolated.
When conditions for entering off mode are met, the PRM proceeds with the sequence.
5. It switches off all domains, including the CORE power domain, and then switches from active mode pad configuration to OFF mode pad configuration.
6. It isolates the pads before the removal of VDD1 and VDD2.
7. It shuts down all analog cells (DPLL, DLL).
8. It switches to off all the DPLL power domains .
9. It sends the off command for VDD1 to the voltage controller
10. It shuts down the SRAM LDOs.
11. The daisy chain is now ready to detect I/O pad wake-up events.
12. The PRM sends the off command for VDD1 to the voltage controller. Through I2C4, the voltage controller requests the power IC to set VDD1 to the voltage corresponding to the PRM_VC_CMD_VAL_0[7:0] OFF bit field. (A legacy mode exists where vmode pins can be used instead of I2C4, depending on the PRM_VOLTCTRL[4] SEL_VMODE bit. In this case, the PRM asserts sys_nvmode1 and the power IC updates VDD1 to its previously programmed value.)
13. Upon reception of the I2C4 transaction acknowledge, and after waiting for the VDD1 regulator setup time counter to expire (the PRM_VOLTSETUP1[15:0] SETUPTIME1 bit field), the PRM sends the off command for VDD2 to the voltage controller. Through I2C4, the voltage controller requests the power IC to set VDD2 to the voltage corresponding to PRM_VC_CMD_VAL_1[7:0] OFF bit field. (If vmode legacy mode is used, the PRM asserts sys_nvmode2 and the power IC restores VDD2 to its previously programmed value.)
14. Upon reception of the I2C4 transaction acknowledge, and after waiting for the VDD2 regulator setup time counter to expire (the PRM_VOLTSETUP1[31:16] SETUPTIME2 bit field), the PRM gates the internal system clock.
15. It releases sys_clkreq and disables the system clock oscillator (if used).
16. The PRM ramps down the wake-up LDO to 1 V.
17. It waits for a wake-up event from the daisy chain or from an internal event (timer) from the WKUP domain.

NOTE: If the I/O pad toggles when the I/O daisy-chain is already configured for the wake-up detection scheme and before the off mode transition occurs, a not real wake-up event is logged in its PADCONF register.

4.11.4.1.2 Device Off-Mode Transition Using Only the SYS_OFF_MODE Signal

Depending on the external power IC capability and the user setting, VDD1 and VDD2 voltage control may use the direct sys_off_mode signal and not send the commands through the I²C interface.

in this case, the initial sequence for device off-mode transition is the same as in [Section 4.11.4.1.1, Device Off-Mode Transition Without Using the SYS_OFF_MODE Signal](#), up to Step 8. After this, the following steps are executed:

1. It shuts down the SRAM LDOs.
2. It asserts sys_off_mode. At this point, VDD1 and VDD2 are shut down.
3. It ramps down the wake-up LDO to 1 V.
4. It releases CLKREQ and disables the system clock oscillator (if used)

5. It waits for a wake-up event from the daisy chain.

4.11.4.2 Wake-Up Sequences

NOTE: vdds_dpll_per and vdds_dpll_dll can be ramped up any time before VDD1 ramps up.

4.11.4.2.1 Device Wakeup from Off Mode Without Using the SYS_OFF_MODE Signal

On detection of a wake-up event from the daisy chain, the PRM performs the following steps:

1. It enables the system clock oscillator, asserts sys_clkreq, and ramps up the wake-up LDO.
2. It waits for the oscillator set-up time and the wake-up LDO stabilization time.
3. It sends the on command for VDD2 to the voltage controller. Through I2C4, the voltage controller requests the power IC to set VDD2 to set the voltage corresponding to the [PRM_VC_CMD_VAL_1\[31:24\]](#) ON bit field. (A legacy mode exists where vmode pins can be used instead of I2C4, depending on the [PRM_VOLTCTRL\[4\]](#) SEL_VMODE bit. In this case, the voltage controller deasserts sys_nvmode2 and the power IC restores VDD2 to its previously programmed value.) At this point, VDD2 ramps up (the reset is not yet asserted on VDD2 logic).
4. It waits for the VDD2 regulator setup time counter to expire ([PRM_VOLTSETUP1\[31:16\]](#) SETUPTIME2).
5. It sends the on command for VDD1 to the voltage controller. Through I2C4, the voltage controller requests the power IC to set VDD1 to set the voltage corresponding to the [PRM_VC_CMD_VAL_0\[31:24\]](#) ON bit field. (If vmode legacy mode is used, the voltage controller deasserts sys_nvmode1 and the power IC restores VDD1 to its previously programmed value). At this point, VDD1 ramps up (the reset is not yet asserted on VDD1 logic).
6. It waits for the VDD1 regulator setup time counter to expire ([PRM_VOLTSETUP1\[15:0\]](#) SETUPTIME1).
7. It restarts the memory LDOs.
8. It powers up all analog cells on the VDD2 domain and waits for the settling time of the LDO and analog cells (internal counter).
9. The following steps can occur in parallel:
 - The DPLL, CORE, and MPU power domains are powered up.
 - The reset on the eFuse controller, DPLL, CORE, , and MPU power domains is asserted.
10. When the CORE, MPU, DPLLs are on, the PRM releases the eFuse controller reset, and the eFuse scan starts.
11. When the scan completes, the DPLL resets are released. The DPLLs are in bypass and the clocks start flowing (DPLL1 and DPLL3).
12. When the CORE and MPU domains are on, the PRM releases their corresponding domain output isolations.
13. When the CORE power domain is on and DPLL3 is in bypass, the reset timer for the CORE power domain starts.
14. When the MPU power domain is on and DPLL1 is in bypass, the reset timer for the MPU power domain starts.
15. When the CORE reset time expires, the CORE domain reset is released.
16. When the CORE domain exits reset and the SCM context and I/O configuration are restored from ScratchPad, memory starts.
17. When the PRM receives the acknowledge from the SCM, it releases the MPU and CORE domain output isolations and the I/O isolation.
18. The PRM switches the I/O pad configuration from off mode configuration to active mode configuration.
19. When the MPU reset time expires and pad configuration returns to normal mode, the MPU domain reset is released.
20. When the MPU boots, the software accesses the control module to read the wake-up event source.
21. The software disables the I/O wake-up daisy chain by clearing the [PRCM.PM_WKEN_WKUP\[8\]](#) EN_IO bit and the [PRCM.PM_WKEN_WKUP\[16\]](#) EN_IO_CHAIN bit.

4.11.4.2.2 Device Wakeup From Off Mode Using Only the SYS_OFF_MODE Signal

Depending on the external power IC capability and the user setting, VDD1 and VDD2 voltage control use the direct sys_off_mode signal and do not send commands through the I²C interface.

in this case, the first part of the sequence in [Section 4.11.4.2.1](#) is as follows.

Upon detection of a wakeup from the daisy chain, the PRM performs the following steps:

1. It enables the system clock oscillator and asserts sys_clkreq.
2. It ramps up the wake-up LDO.
3. It releases sys_off_mode.
4. It waits for the system clock oscillator setup time.
5. It waits for VDD1 and VDD2 setup time. The two counts are started in parallel.
6. When both timers expire, the following steps happen in parallel:
 - Reset is asserted on the MPU and CORE power domains.
 - The MPU and CORE power domains are powered up.
 - The PRM restarts the CORE and processor memory LDOs.
 - The PRM powers up all analog cells in the VDD1 and VDD2 domains.

4.12 PRCM Basic Programming Model

The PRCM module supports an extensive set of module-specific registers that allow programming control over numerous features of the clocks, resets, and power-management signals for each power domain of the device.

These registers are fully programmable and accessible by the MPU and the IVA2.2 subsystems.

Logically, the registers are grouped into five categories:

- Global
- Clock management
- Reset management
- Power management
- Voltage management

4.12.1 Global Registers

4.12.1.1 Revision Information Registers

- [CM_REVISION](#): Indicates the CM module revision code; it is read-only
- [PRM_REVISION](#): Indicates the PRM module revision code; it is read-only

4.12.1.2 PRCM Configuration Registers

- [CM_SYSCONFIG](#): Holds an AUTOIDLE bit to control the CM internal clock autogating feature
- [PRM_SYSCONFIG](#): Holds an AUTOIDLE bit to control the PRM internal clock autogating feature

4.12.1.3 Interrupt Configuration Registers

The PRM can interrupt the MPU and the IVA2.2 subsystems as a result of four events:

- PRM internal event (event generator, sleep transition, wake-up transition, voltage controller)
- Peripheral wake-up event for a peripheral with interrupt capability (GPTIMER[1..11], GPIO[1..6], McBSP[1..5], UART[1..3], HS USB OTG, I2C[1..3], McSPI[1..4], MMC[1,2])
- Module/device-level event not associated with any interrupt (DPLL recalibration, I/O wakeup)

The PRM interrupt is enabled by programming the PRM_IRQENABLE_<processor_name> register; the interrupt status can be read from the PRM_IRQSTATUS_<processor_name> register.

The device has four processor interrupt registers:

- [PRM_IRQSTATUS_MPU](#)

- [PRM_IRQENABLE_MPU](#)
- [PRM_IRQSTATUS_IVA2](#)
- [PRM_IRQENABLE_IVA2](#)

4.12.1.3.1 MPU Interrupt Event Sources

The MPU interrupt registers correspond to the interrupt sources connected to the interrupt line mapped to the MPU interrupt controller.

Multiple events can activate this interrupt line:

- MPU peripheral group wake-up event
- Event-generator module end-of-on time and end-of-off time events
- Sleep or wake-up transition (SGX, USBHOST, IVA2, PER, DSS, CAM, NEON, EMU power domains)
- DPLL1/DPLL2/DPLL3/DPLL4/DPLL5 recalibration request
- I/O pad wake-up event
- Slave address in an I²C frame sent by the voltage controller not acknowledged by the power IC device
- Register address in an I²C frame sent by the voltage controller not acknowledged by the power IC device
- Last byte of an I²C frame issued from the bypass port or the voltage manager FSM ports sent by the voltage controller not acknowledged by the power IC device

The end-of-on time period and end-of-off time period events of the event generator module are sources of interrupts to the MPU processor (the corresponding bits in the [PRM_IRQENABLE_MPU](#) are set to 1). The end-of-off time period is the source of wake-up events on the MPU domain.

The MPU can force a sleep or wake-up transition on some domains (SGX, USBHOST, IVA2, PER, DSS, CAM, NEON, EMU). The PRM triggers the MPU interrupt when the domain enters a power state. The software must clear the `CM_CLKSTCTRL_<domain_name>` register only after getting the interrupt. If the software clears this bit before getting the interrupt, the interrupt never occurs, regardless of whether the transition occurs.

An interrupt for a peripheral with wake-up capability is enabled when the wake-up enable bit (`PM_WKEN_<domain_name>` register type) and group select bit (`PM_<processor_name>GRPSEL_<domain_name>` type of register) are set to 1.

The PRM triggers its interrupt line on the I/O daisy chain wake-up event. This wake-up event is enabled by setting the corresponding bit in the `PRCM.PM_WKEN_WKUP` register to 1.

The PRM triggers the MPU interrupt as long as the DPLL recalibration flag is set and the corresponding interrupt enable bit in the `PRM_IRQENABLE_<processor_name>` register is set to 1. The recalibration flag is set by the DPLL and remains active if the DPLL is not reinitialized.

4.12.1.3.2 MPU Interrupt Registers

4.12.1.3.2.1 PRM_IRQENABLE_MPU (MPU Interrupt Enable Register)

The MPU interrupt enable register allows independent masking/unmasking of each MPU internal interrupt source.

NOTE: If the following interrupts are enabled and the MPU power domain is idled, then when the event occurs, the PRCM module sets the interrupt that wakes up the power domain:

- DPLL1/DPLL2/DPLL3/DPLL4/DPLL5 recalibration event
 - Voltage controller errors
-

4.12.1.3.2.2 PRM_IRQSTATUS_MPU (MPU Interrupt Status Register)

The MPU interrupt status register provides the status of all PRCM internal events that can generate an MPU interrupt. Software must read this register to identify the interrupt cause, and then clear the pending interrupt by setting the corresponding bit to 1.

4.12.1.3.3 IVA2.2 Interrupt Event Sources

The IVA2.2 interrupt registers correspond to the interrupt sources connected to the interrupt line mapped to the IVA2.2 interrupt controller.

Three events can activate this interrupt line:

- An IVA2.2 peripheral group wake-up event
- A force wake-up transition completion (IVA2 domain)
- A required IVA2 DPLL recalibration

The PRM also interrupts IVA2.2 if the corresponding bit in the [PM_IVA2GRPSEL_WKUP](#) register is set to 1.

The PRM triggers the interrupt line dedicated to the IVA2 processor when the MPU performs a force wake-up transition on the IVA2 domain. This interrupt is triggered under the same conditions as that of the MPU.

The PRM triggers an IVA2.2 interrupt if the DPLL recalibration flag is set and the corresponding interrupt enable bit in the `PRM_IRQENABLE_<processor_name>` register is set to 1. The recalibration flag is set by the DPLL and remains active if the DPLL is not reinitialized.

4.12.1.3.4 IVA2 Interrupt Registers

4.12.1.3.4.1 PRM_IRQENABLE_IVA2 (IVA2.2 Interrupt Enable Register)

The IVA2.2 interrupt enable register allows independent masking/unmasking of each of the three internal interrupt sources.

NOTE: If the IVA2 DPLL recalibration event interrupt is enabled and the IVA2 power domain is idled, then when the event occurs, the PRCM module sets the interrupt, thus waking up the power domain.

4.12.1.3.4.2 PRM_IRQSTATUS_IVA2 (IVA2.2 Interrupt Status Register)

The IVA2.2 interrupt status register provides the status of the three events that can generate an IVA2.2 interrupt. Software must read the register to identify the interrupt cause, and then clear the pending interrupt by setting the corresponding bit to 1.

4.12.1.4 Event Generator Control Registers

For details about the event generator module, see the public *ARM Cortex-A8* technical reference manual.

In the PRCM module, three event generator registers allow configuration of the event generator module:

- [PM_EVGENCTRL_MPU](#) (event generator control register): Event-generator settings
- [PM_EVGENONTIM_MPU](#) (event generator on-time register): On-time duration setting
- [PM_EVGENOFFTIM_MPU](#) (event generator off-time register): Off-time duration setting

4.12.1.5 Output Signal Polarity Control Registers

4.12.1.5.1 CM_POLCTRL (CM Polarity Control Register)

The [CM_POLCTRL](#) register allows the setting of the polarity of `sys_clkout2` when gated (disabled). `sys_clkout2` can be gated to a low level or a high level, depending on the software programming of this register. [Figure 4-78](#) shows the normal behavior of `sys_clkout2` when gated.

Figure 4-78. sys_clkout2 Gating Polarity Control

4.12.1.5.2 **PRM_POLCTRL (PRM Polarity Control Register)**

The PRM polarity control register allows the setting of the polarity of the external signals controlled by the PRM. It contains the following polarity control bits:

- OFFMODE_POL: Polarity of sys_off_mode
- CLKOUT_POL: Polarity of sys_clkout1
- CLKREQ_POL: Polarity of sys_clkreq
- EXTVOL_POL: Polarity of both sys_nvmode signals: sys_nvmode1 and sys_nvmode2

At device power up, the reset values of polarity settings are OFFMODE_POL = 1 and CLKREQ_POL = 1. For details about using these signals, see [Section 4.7, Clock Manager Functional Description](#).

4.12.1.6 **SRAM Precharge Time Control Register**

4.12.1.6.1 **PRM_SRAM_PCHARGE (Voltage SRAM Precharge Counter Register)**

The voltage SRAM precharge counter register allows the setting of the precharge duration of the SRAM. It has following bit field:

- PCHARGE_TIME: Number of system clock cycles defined for the SRAM precharge duration

4.12.2 **Clock Management Registers**

4.12.2.1 **System Clock Control Registers**

4.12.2.1.1 **PRM_CLKSRC_CTRL (Clock Source Control Register)**

The clock source control register is dedicated to the clock source controls of the device. It contains the following bit fields:

- SYSCLKSEL: Indicates the oscillator mode (oscillator/bypass) and is automatically updated at power up
- AUTOEXTCLKMODE: Enables autogating for the system clock, depending on the device power state. The clock can be configured to be automatically gated when all power domains are in either off or retention state. When the gating condition is satisfied, the internal oscillator is turned off, if it is used. Otherwise, sys_clkreq is asserted to notify the external clock source to turn off.

NOTE: Power consumption is reduced with the SYS_CLK off; however, wake-up latency is increased because of oscillator stabilization time after the clock is turned on again.

- SYSCLKDIV: Input divider (1, 2) of the system clock

4.12.2.1.2 **PRM_CLKSETUP (Source-Clock Setup Register)**

The source-clock setup register allows the setting of the setup time of the oscillator system clock, based on the number of 32-kHz clock cycles. This duration corresponds to the time required by the oscillator to stabilize before propagating the system clock.

Because the reset lasts long enough for oscillator stabilization, this register is not used at power-on reset of the device. This is ensured either by the external reset source (power IC) or by the reset extension in the PRCM module (RSTTIME0 timer). The [PRM_CLKSETUP](#) register is cleared on cold reset only.

NOTE: The clock setup time is implemented using the oscillator mode or the external clock mode (bypass mode). (The mode of the oscillator is selected by the SYSCLKSEL bits in the [PRM_CLKSRC_CTRL](#) register).

4.12.2.1.3 **PRM_CLKSEL (Source-Clock Selection Register)**

The PRCM.PRM_CLKSEL[2:0] SYS_CLKIN_SEL bit field is used to select the input frequency of the system clock (12, 13, 16.8, 19.2, 26 or 38.4 MHz).

4.12.2.2 External Clock Output Control Registers

4.12.2.2.1 **PRM_CLKOUT_CTRL (Clock Out Control Register)**

The PRM clock out control register provides control to enable and disable the gating of the sys_clkout1 output clock.

4.12.2.2.2 **CM_CLKOUT_CTRL (Clock Out Control Register)**

The CM clock out control register provides control over the device output clock sys_clkout2, which can be used externally for functional or test purposes. The register allows the following:

- Selection of the source clock for sys_clkout2:
 - CORE_CLK
 - CM_SYS_CLK
 - 96-MHz clock
 - 54-MHz clock
- Dividing-down the selected source clock by 1, 2, 4, 8, or 16
- Enabling/disabling of the gating of sys_clkout2

4.12.2.3 DPLL Clock Control Registers

A set of registers controls the clock features of the five DPLLs (DPLL1, DPLL2, DPLL3, DPLL4, and DPLL5):

- CM_CLKSELn_PLL_<processor_name>
- CM_CLKSELn_PLL
- CM_CLKEN_PLL_<processor_name>
- [CM_CLKEN_PLL](#)
- CM_AUTOIDLE_PLL_<processor_name>
- [CM_AUTOIDLE_PLL](#)
- CM_IDLEST_PLL_<processor_name>
- [CM_IDLEST_CKGEN](#)
- [CM_IDLEST2_CKGEN](#)

The following sections describe the purposes of these registers.

4.12.2.3.1 **CM_CLKSELn_PLL_<processor_name> (Processor DPLL Clock Selection Register)**

The processor DPLL clock selection register controls the clock configuration of DPLL1 and DPLL2, including the following features:

- The multiplier (M) and divider (N) values of the DPLL
- Selection of the fast bypass clock (CORE_CLK or CORE_CLK/2) in bypass mode
- Configuration of DPLL output clock divider values (M2 factor)

The device has four DPLL clock selection registers for DPLL1 and DPLL2:

- [CM_CLKSEL1_PLL_MPU](#): DPLL1 multiplier, divider, and fast bypass clock selection
- [CM_CLKSEL2_PLL_MPU](#): DPLL1 output clock divider selection
- [CM_CLKSEL1_PLL_IVA2](#): DPLL2 multiplier, divider, and fast bypass clock selection
- [CM_CLKSEL2_PLL_IVA2](#): DPLL2 output clock divider selection

4.12.2.3.2 **CM_CLKSELn_PLL (DPLL Clock Selection Register)**

The DPLL clock selection register controls the clock configuration for DPLL3, DPLL4, and DPLL5, including the following features:

- The multiplier (M) and divider (N) values of the DPLL
- Configuration of DPLL output clock divider values

The device has the following DPLL clock selection registers for DPLL3, DPLL4, and DPLL5:

- [CM_CLKSEL1_PLL](#): DPLL3 multiplier, divider, and output clock division configuration. Source selection for the 54-MHz and 48-MHz clock (48M_FCLK) between DPLL4 output and sys_altclk.
- [CM_CLKSEL2_PLL](#): DPLL4 multiplier and divider configuration
- [CM_CLKSEL3_PLL](#): Divider configuration for 96-MHz clock (96M_FCLK)
- [CM_CLKSEL4_PLL](#): DPLL5 multiplier and divider configuration
- [CM_CLKSEL5_PLL](#): Divider configuration for 120-MHz clock (120M_FCLK)

4.12.2.3.3 **CM_CLKEN_PLL_ <processor_name> (Processor DPLL Clock Enable Register)**

The processor DPLL clock enable register allows the enabling or disabling of DPLL1 and DPLL2. It allows an immediate setting of the DPLL.

The device has two DPLL clock enable registers, one for DPLL1 and one for DPLL2:

- [CM_CLKEN_PLL_MPU](#): DPLL1 (MPU)
- [CM_CLKEN_PLL_IVA2](#): DPLL2 (IVA2)

The [CM_CLKEN_PLL_<processor_name>](#) register allows programmable control of the following DPLL features:

- Low-power stop mode (only for DPLL2)/low-power bypass mode/lock mode selection
- Automatic recalibration enable/disable
- Programmable internal frequency range of the DPLL
- The DPLL LP mode can be enabled or disabled. However, switching between LP and normal mode is effective only when the DPLL has performed a recalibration; therefore, the DPLL must lock or relock. Also, the LP mode control is considered only during the following transitions:
 - From bypass to lock
 - From stop mode to lock
 - From lock to relock

NOTE: DPLL1 enters its internal power state (MNBYPASS) after being released from reset or when a multiplier value of 0 or 1 is loaded into the DPLL. Therefore, even if the [CM_CLKEN_PLL_MPU\[2:0\] EN_MPU_DPLL](#) bit field is reset to the low-power bypass mode, DPLL1 automatically transitions to MNBYPASS mode, because the multiplier value (the [CM_CLKSEL1_PLL_MPU\[18:8\] MPU_DPLL_MULT](#) bit field) resets to 0.

4.12.2.3.4 **CM_CLKEN_PLL (DPLL Enable Register)**

The DPLL enable register allows control of DPLL3, DPLL4, and DPLL5. It allows an immediate setting of the DPLLs. This register controls the following features of the two DPLLs:

- DPLL operation mode:
 - Low-power bypass, fast-relock bypass, and lock modes for DPLL3
 - Low-power bypass and lock modes for DPLL4
- Programmable automatic recalibration
- Programmable internal frequency range for the DPLL
- Frequency ramp-up feature disable/enable with programmable step duration
- The DPLL3 output M3X2 and the DPLL4 outputs M2X2, M3X2, M4X2, M5X2, and M6X2 clock paths can be powered down. However, the setting takes effect only when the output clock is gated. It is also powered down whenever the DPLL is in stop mode, regardless of the software settings.

- The DPLL LP mode can be enabled or disabled. However, switching between LP and normal mode is effective only when the DPLL has performed a recalibration; therefore, the DPLL must lock or relock. Also, the LP mode control is considered only during the following transition:
 - From bypass to lock
 - From stop mode to lock
 - From lock to relock

4.12.2.3.5 **CM_AUTOIDLE_PLL_ <processor_name> (Processor DPLL Autoidle Register)**

The processor DPLL autoidle register allows the enabling/disabling of the automatic processor DPLL activity control. In automatic mode, the DPLL automatically enters low-power stop mode when the DPLL clock is not required. It is also restarted automatically.

The following are the device DPLL autocontrol registers:

- [CM_AUTOIDLE_PLL_MPU](#): DPLL1 autoidle mode control
- [CM_AUTOIDLE_PLL_IVA2](#): DPLL2 autoidle mode control

4.12.2.3.6 **CM_AUTOIDLE_PLL (DPLL Autoidle Register)**

The DPLL autoidle register allows the enabling/disabling of the automatic mode-switching control for DPLL3 and DPLL4. This automatic mode takes effect only when the DPLLs are locked.

DPLL3 can be configured to automatically switch to either low-power bypass mode or low-power stop mode when the CORE power domain clock is not required.

DPLL4 can be configured to automatically switch to low-power stop mode when the PER power domain clock is not required.

4.12.2.3.7 **CM_AUTOIDLE1_PLL (DPLL5 Autoidle Register)**

The DPLL5 autoidle register allows the enabling/disabling of the automatic mode-switching control. This automatic mode takes effect only when the DPLL is locked.

When enabled, DPLL5 is automatically switched to low-power stop mode whenever the 120-MHz output clock is gated.

4.12.2.3.8 **CM_IDLEST_CKGEN (Source-Clock Idle-Status Register)**

The source-clock idle-status register provides a status of DPLL3 and DPLL4 clock activity. It also provides the status of the functional clocks derived from DPLL4 output.

The activity status for DPLL3 and DPLL4 can be:

- DPLL is bypassed.
- DPLL is locked.

The activity status for the functional clocks can be:

- The functional 96-MHz clock is active, or not.
- The functional 48-MHz clock is active, or not.
- The functional 12-MHz clock is active, or not.
- The functional 54-MHz clock is active, or not.

The functional 96-MHz clock and all other functional clocks derived from it are active only when DPLL4 is locked and the clock is required.

The functional 48-MHz and 12-MHz clocks are qualified as active only if the clock is required and when the external alternate clock is selected as the source clock.

The functional 54-MHz clock (DSS_TV_CLK) is active only when DPLL4 is locked, selected as the source clock, and required.

4.12.2.3.9 CM_IDLEST2_CKGEN (DPLL5 Source-Clock Idle-Status Register)

The source-clock idle-status register provides the status of DPLL5 clock activity. It also provides the status of the functional clocks derived from DPLL5 output.

The activity status for DPLL5 can be:

- DPLL is bypassed.
- DPLL is locked.

The activity status for the functional clocks can be:

- The 120-MHz functional clock is active, or not.
- The output stage of the 120-MHz functional clock is active, or not.

4.12.2.3.10 CM_IDLEST_PLL_ <processor_name> (Processor DPLL Idle-Status Register)

The processor DPLL idle-status register indicates the status of the processor DPLL: whether it is in locked or bypass mode.

The device DPLL idle-status registers are:

- [CM_IDLEST_PLL_MPU](#): DPLL1 activity status
- [CM_IDLEST_PLL_IVA2](#): DPLL2 activity status

4.12.2.4 Power-Domain Clock Control Registers

An identical set of registers controls the clock features of the power domains in the device:

- [CM_CLKSEL_<domain_name>](#)
- [CM_FCLKEN_<domain_name>](#)
- [CM_ICLKEN_<domain_name>](#)
- [CM_AUTOIDLE_<domain_name>](#)
- [CM_IDLEST_<domain_name>](#)
- [CM_CLKSTCTRL_<domain_name>](#)
- [CM_CLKSTST_<domain_name>](#)
- [CM_SLEEPDEP_<domain_name>](#)

The following sections describe the purposes of these registers.

4.12.2.4.1 CM_CLKSEL_ <domain_name> (Clock Select Register)

The clock select register controls the selection of the module or subsystem input clock frequency (except for the processor modules). Therefore, it deals only with modules or subsystems for which the frequency is scalable or selectable (the others have fixed and nonprogrammable frequencies). Both functional and interface clocks can be scaled. In most cases, their value is a divided value from the DPLL3 (CORE) or the DPLL4 (PER) output clock.

The device includes the following clock select registers:

- [CM_CLKSEL_CORE](#): L3 and L4 interconnects, and GPTIMER10 and 11 functional clocks
- [CM_CLKSEL_CAM](#): Camera subsystem functional clock
- [CM_CLKSEL_DSS](#): DSS functional clock 1 and TV functional clock
- [CM_CLKSEL_PER](#): GPTIMER2, 3, 4, 5, 6, 7, 8, and 9 functional clocks
- [CM_CLKSEL_SGX](#): SGX subsystem functional clock
- [CM_CLKSEL_WKUP](#): GPTIMER1 functional clock and reset manager counter clock

The 32-kHz functional clock (32K_FCLK) is selected when the device enters off mode. The functional clock of the GPTIMER1 is selectable between the always-on 32K_FCLK and the system clock (SYS_CLK), but it is used with the 32-kHz clock.

The [CM_CLKSEL_SGX](#) register controls the SGX functional clock divider ratio, which is divided from the L3_ICLK source clock. [Table 4-81](#) summarizes L3_ICLK ratio for different configurations of the register field.

Table 4-81. GFX Functional Clock Ratio Settings

CM_CLKSEL_SGX.CLKSEL_SGX	SGX_L3_FCLK
0x1	L3_ICLK
0x2	L3_ICLK/2
0x3	L3_ICLK/3
0x4	L3_ICLK/4

4.12.2.4.2 **CM_FCLKEN_ <domain_name> (Functional Clock Enable Register)**

The functional clock enable register allows control of the functional clock activity of each module or subsystem. All module functional clocks are controllable by software, except for the MPU, interconnect, and memory subsystems, for which the clocks are automatically controlled by the PRCM.

The device has the following functional clock control registers:

- **CM_FCLKEN1_CORE** and **CM_FCLKEN3_CORE**: CORE domain peripherals set
- **CM_FCLKEN_CAM**: Camera subsystem
- **CM_FCLKEN_DSS**: DSS subsystem
- **CM_FCLKEN_PER**: PER domain peripherals set
- **CM_FCLKEN_IVA2**: IVA2.2 subsystem
- **CM_FCLKEN_SGX**: SGX subsystem
- **CM_FCLKEN_WKUP**: WKUP domain peripherals set
- **CM_FCLKEN_USBHOST**: HS USB Host subsystem

The software effect is immediate and direct. The functional clock is turned on as soon as the bit is set, and turned off if the bit is cleared and the clock is not required by any module. On module wakeup, the functional clock can be automatically restarted.

NOTE: The functional clock supplies the functional part of a module or subsystem, which is not operational without its functional clock. In some cases, a module or a subsystem may require multiple functional clocks.

4.12.2.4.3 **CM_ICLKEN_ <domain_name> (Interface Clock Enable Register)**

The interface clock enable register allows control of the interface clock activity of each module or subsystem. This register provides control over each module in the device.

The device has following interface clock control registers:

- **CM_ICLKEN1_CORE** and **CM_ICLKEN3_CORE**: CORE domain peripherals set
- **CM_ICLKEN_CAM**: Camera subsystem
- **CM_ICLKEN_DSS**: DSS subsystem
- **CM_ICLKEN_PER**: PER domain peripherals set
- **CM_ICLKEN_SGX**: SGX subsystem
- **CM_ICLKEN_WKUP**: WKUP domain peripherals set
- **CM_ICLKEN_USBHOST**: HS USB Host subsystem

This register has an immediate effect, causing the source of the interface clock to be effectively cut (if the appropriate bit is cleared and no module requires this clock) or activated (if the appropriate bit is set).

Independent functional and interface clock control registers provide potential power savings for each module. For example, because the configuration port and interface of the module are still active, disabling a functional clock of a module while keeping its interface clock active (leaving the module inactive but allowing access to its registers) reduces power consumption.

When the interface clock is disabled, the module cannot communicate with the reset of the device; therefore, it is in idle mode. For example, the interface clock of a peripheral can be disabled while its functional clock is active; it is then idled, from the device standpoint, while it can detect any external event. This configuration typically allows a main part of the device to go into idle mode while keeping a peripheral active and ready to wake up from an external event.

Because a module may or may not be able to function without its functional or interface clocks, power-management strategies must be adapted accordingly. This relation is programmable and is defined in the CLOCKACTIVITY bits of the module SYSCONFIG register; therefore, it requires consistent programming of the CM_FCLKEN and CM_ICLKEN registers.

NOTE: The interface clock ensures proper communication between any module and the interconnect (L3 or L4), in most cases supplying the module interface and registers.

4.12.2.4.4 CM_AUTOIDLE_ <domain_name> (Autoidle Register)

The autoidle register holds an AUTOIDLE bit per module that belongs to the related power domain. Each AUTOIDLE bit enables/disables automatic (hardware) gating of a module interface clock.

When AUTOIDLE and ICLKEN are set for a module, the module interface clock is managed automatically (that is, by hardware control) according to the power domain clock activity; for example, stopped before a power domain sleep transition and reenabled on wakeup. [Table 4-82](#) lists the possible autoidle settings for the interface clock.

Table 4-82. Interface Clock Autoidle Settings

CM_AUTOIDLE.AUTO_<module>	CM_ICLKEN.EN_<module>	Interface Clock
0	0	Disabled
0	1	Enabled
1	0	Disabled
1	1	Automatic enabling/disabling

The device has the following autoidle control registers:

- [CM_AUTOIDLE1_CORE](#) and [CM_AUTOIDLE3_CORE](#): CORE domain peripherals set
- [CM_AUTOIDLE_CAM](#): Camera subsystem
- [CM_AUTOIDLE_DSS](#): DSS subsystem
- [CM_AUTOIDLE_PER](#): PER domain peripherals set
- [CM_AUTOIDLE_WKUP](#): WKUP domain peripherals set
- [CM_AUTOIDLE_USBHOST](#): HS USB Host subsystem

NOTE: For IVA2.2, and GFX modules, the automatic idle mode is always enabled, and is not software-controllable.

4.12.2.4.5 CM_IDLEST_ <domain_name> (Idle-Status Register)

The idle-status register allows checking whether a target module is in idle mode or if an initiator module is in standby mode. The software should not access a target module in idle mode. A target access in this state can lead to an error.

The idle mode of any module can depend on the configuration of the CM_FCLKEN_<domain_name> and CM_ICLKEN_<domain_name> registers, or may be controlled automatically by hardware, depending on the configuration of the CM_AUTOIDLE_<domain_name> registers.

In the case of IVA2.2 subsystem, standby mode is reached after the IVA2.2 processor has performed its idle instruction.

The device has the following idle status registers:

- [CM_IDLEST_MPU](#): MPU subsystem

- [CM_IDLEST1_CORE](#) and [CM_IDLEST3_CORE](#): CORE domain peripherals set
- [CM_IDLEST_CAM](#): Camera subsystem
- [CM_IDLEST_DSS](#): DSS
- [CM_IDLEST_PER](#): Peripheral domain peripherals set
- [CM_IDLEST_NEON](#): NEON subsystem
- [CM_IDLEST_IVA2](#): IVA2.2 subsystem
- [CM_IDLEST_SGX](#): SGX subsystem
- [CM_IDLEST_WKUP](#): WKUP domain peripherals set
- [CM_IDLEST_USBHOST](#): HS USB Host subsystem

4.12.2.4.6 [CM_CLKSTCTRL_<domain_name>](#) (Clock State Control Register)

The clock state control register holds a [CLKTRCTRL_<clock domain>](#) bit field for each clock domain in the power domain. It controls the hardware- and software-supervised state transitions between active and inactive states. [Table 4-83](#) lists the clock state transition settings.

Table 4-83. Clock State Transition Settings

CM_CLKSTCTRL_<pwr domain> , CLKTRCTRL_<clk domain>	Description
0x0	The automatic hardware-supervised mode is disabled. The clocks in a clock domain cannot be cut automatically. This prevents any power transition on the power domain.
0x1	Starts software-supervised (forced) sleep transition on the domain. All clocks in the clock domain are automatically cut whenever the initiators in the modules are in standby mode.
0x2	Starts software-supervised (forced) wake-up transition on the domain. The clocks in the clock domain are restarted.
0x3	The automatic hardware-supervised mode is enabled, and the clocks in the clock domain are automatically cut whenever the modules and subsystem in the clock domain are in idle or standby mode and the domain dependencies are met.

The hardware-supervised mode and the software-supervised (forced) sleep mode are mutually exclusive. It is a software decision to program one mode or another, and the software programs the PRCM module accordingly.

The hardware-supervised mode is coupled to the sleep and wake-up dependencies programmed in the PRCM module, whereas the software-supervised mode must be independent of those dependencies. Therefore, the sleep and wake-up dependencies must be disabled before the software forces a sleep transition on a power domain; otherwise, the forced-domain will be wakened immediately because of the wake-up dependency.

The device has the following clock state control registers:

- [CM_CLKSTCTRL_MPU](#): MPU subsystem clock domain
- [CM_CLKSTCTRL_CORE](#): L3, L4, and D2D clock domains
- [CM_CLKSTCTRL_CAM](#): Camera subsystem clock domain
- [CM_CLKSTCTRL_DSS](#): DSS clock domain
- [CM_CLKSTCTRL_PER](#): Peripherals clock domain
- [CM_CLKSTCTRL_NEON](#): NEON clock domain
- [CM_CLKSTCTRL_IVA2](#): IVA2.2 clock domain
- [CM_CLKSTCTRL_SGX](#): Graphics clock domain
- [CM_CLKSTCTRL_EMU](#): Emulation clock domain
- [CM_CLKSTCTRL_USBHOST](#): HS USB Host clock domain

The CORE domain has three clock domains (L3, L4, and D2D); it does not have forced sleep and forced wake-up ability.

Although the sleep transition in the MPU power domain cannot be initiated by software using this register, a software-initiated forced wake-up capability exists. This can be used to wake up the MPU power domain if it does not wake up when the CORE power domain wakes up (the MPU wake-up-dependency [PM_WKDEP_MPU\[0\] EN_CORE](#) bit is set to 0).

If the hardware-supervised mode is enabled, the following occur:

- The MPU domain clock is automatically cut if the MPU executes the wait-for-interrupt instruction.
- The IVA2 domain clock is automatically cut when the DSP completes its idle procedure, and the IVA2.2 subsystem is ready for standby.
- The L3 domain clock is automatically cut when all initiators are in standby mode and slave ports are idled.
- The L4 domain clock is automatically cut when all peripherals and slave ports are idled.
- The DSS interface clock is automatically cut when it stops fetching data from the frame buffer (provided the MPU is also in standby mode, if sleep dependency in the MPU power domain is enabled). The display functional clock is controlled only by the [CM_FCLKEN_DSS](#) register.
- The PER domain clock is automatically cut when all initiators are in standby mode and all slave ports are in idle (provided the MPU and the DSP are in standby mode and the CORE power domain is inactive, if sleep dependency in their domains is enabled).
- The USBHOST power domain clock is automatically cut whenever the USBHOST is in standby mode (provided MPU is also in standby mode, if sleep dependency in the MPU domain is enabled, and IVA2 is also in standby mode, if sleep dependency in the IVA2 domain is enabled).
- Because of the hardwired sleep dependency between NEON and the MPU domain, NEON can go into idle only if the MPU goes into standby mode. The MPU domain must also be configured in automatic hardware supervised mode for the NEON power domain idle transition to occur.

4.12.2.4.7 [CM_CLKSTST_<domain_name>](#) (Clock State Status Register)

The clock state status register logs the activity status of the power domain clock. This includes the activity of the interface clocks running only on the domain.

The device has following clock state status registers:

- [CM_CLKSTST_MPU](#): MPU subsystem clock activity
- [CM_CLKSTST_CORE](#): L3 clock domain activity and L4 clock domain activity
- [CM_CLKSTST_CAM](#): Camera subsystem clock activity
- [CM_CLKSTST_DSS](#): DSS clock activity
- [CM_CLKSTST_PER](#): PER clock domain activity
- [CM_CLKSTST_IVA2](#): IVA2.2 clock domain activity
- [CM_CLKSTST_SGX](#): Graphics subsystem clock activity
- [CM_CLKSTST_EMU](#): Emulation clock activity
- [CM_CLKSTST_USBHOST](#): USBHOST clock activity

4.12.2.4.8 [CM_SLEEPDEP_<domain_name>](#) (Sleep Dependency Control Register)

The sleep dependency control register allows the enabling or disabling of the sleep transition dependency of a power domain with respect to other power domains.

The device has following sleep dependency registers:

- [CM_SLEEPDEP_CAM](#): CAM power domain sleep dependency with the MPU power domain
- [CM_SLEEPDEP_DSS](#): Display power domain sleep dependency with the MPU power domain and the IVA2 power domain
- [CM_SLEEPDEP_PER](#): PER power domain sleep dependencies with the MPU, IVA2, and CORE power domains
- [CM_SLEEPDEP_SGX](#): SGX power domain sleep dependency with the MPU power domain
- [CM_SLEEPDEP_USBHOST](#): USBHOST power domain sleep dependency with the MPU and IVA2 power domains

Although the CORE power domain is composed of L3 and L4 clock domains, the sleep dependency with the L3 clock domain is always enabled (not programmable by software); there is no sleep dependency between the PER power domain and the CORE_L4 clock domain.

The dependencies listed in [Table 4-84](#) can be enabled or disabled by software.

Table 4-84. Sleep Dependency Settings

Dependent Domain	Parent Domain		
	MPU	IVA2	CORE-L3
CAM	Software controlled		
DSS	Software controlled	Software controlled	
PER	Software controlled	Software controlled	Always enabled
SGX	Software controlled		
USBHOST	Software controlled	Software controlled	

4.12.2.5 Domain Wake-Up Control Registers

The following modules have programmable wake-up control:

- CORE power domain:
 - USBTLL
 - HS USB OTG
 - McBSP 1 and 5
 - GPTIMER[10, 11]
 - UART[1,2]
 - I2C[1..3]
 - McSPI[1..4]
 - MMC[1,2, 3]
- PER power domain:
 - McBSP[2..4]
 - GPTIMER[2..9]
 - UART 3
 - WDTIMER3
 - GPIO[2..6]
- WKUP power domain:
 - GPTIMER1
 - GPIO1
 - I/O pad
- DSS power domain:
 - DSS subsystem
- USBHOST power domain:
 - HS USB Host subsystem

The registers in the following sections control the wake-up settings.

4.12.2.5.1 *PM_WKEN_<domain_name> (Wake-Up Enable Register)*

The wake-up enable register applies only to modules that can generate wake-up events. It allows the enabling or disabling of the wakeup of the related power domain on a module or subsystem wake-up event. Each EN_<module> bit in the register enables/disables the wake-up event from the module to the PRCM module.

The device has the following wake-up enable registers:

- [PM_WKEN1_CORE](#) and [PM_WKEN3_CORE](#): CORE domain modules wake-up control
- [PM_WKEN_DSS](#): Display subsystem (DSS) wake-up control

- **PM_WKEN_PER**: Peripheral domain modules wake-up control
- **PM_WKEN_WKUP**: WKUP domain modules wake-up control
- **PM_WKEN_USBHOST**: HS USB Host subsystem wake-up control

NOTE: The wake-up signals issued from the MPU and IVA2.2 INTCs are nonmaskable in the PRCM module. However, they cannot be generated if the corresponding interrupts are masked in the INTCs.

4.12.2.5.2 **PM_WKST_ <domain_name> (Wake-Up Status Register)**

The wake-up status register logs wake-up events from all modules. Each ST_<module> bit of this register logs a given module-generated wake-up event.

The device has the following wake-up status registers:

- **PM_WKST1_CORE** and **PM_WKST3_CORE**: CORE domain modules wake-up event status
- **PM_WKST_PER**: Peripheral domain modules wake-up event status
- **PM_WKST_WKUP**: WKUP domain modules wake-up event status
- **PM_WKST_USBHOST**: HS USB Host subsystem wake-up control

The functional clock of the module causing the wakeup automatically restarts on the wakeup, but the software must enable the functional clock (CM_FCLKEN_<domain_name> register) before clearing the wake-up status bit.

NOTE:

- Software must clear this register before a new sleep transition request; otherwise, the register prevents the sleep transition from occurring.
 - If the PRM interrupt is enabled on a module wakeup, the PM_WKST_<domain_name> must be cleared before clearing the PRM_IRQSTATUS_<processor_name> interrupt status register.
-

4.12.2.5.3 **PM_WKDEP_ <domain_name> (Wake-Up Dependency Register)**

The wake-up dependency register allows the enabling/disabling of a wake-up dependency between power domains. When a domain wakes up, it can wake up another domain.

The device has the following wake-up dependency registers:

- **PM_WKDEP_MPU**: MPU power domain wake-up dependency with the following domains:
 - CORE
 - IVA2
 - WKUP
 - DSS
 - PER
- **PM_WKDEP_DSS**: DSS power domain wake-up dependency with the following domains:
 - MPU
 - IVA2
 - WKUP
- **PM_WKDEP_CAM**: The CAM power domain has programmable wake-up dependency with the following domains:
 - MPU
 - IVA2
 - WKUP
- **PM_WKDEP_PER**: The PER power domain has programmable wake-up dependency with the following domains:
 - MPU

- IVA2
- WKUP
- CORE

The PER power domain can be wakened only by a wakeup of the L3 and D2D clock domains, not by an L4 clock domain.

- **PM_WKDEP_NEON**: The NEON power domain has programmable wake-up dependency with the following domain:
 - MPU
- **PM_WKDEP_IVA2**: The IVA2 power domain has programmable wake-up dependency with the following domains:
 - MPU
 - PER
 - WKUP
 - CORE
- **PM_WKDEP_SGX**: The SGX power domain has programmable wake-up dependency with the following domains:
 - MPU
 - IVA2
 - WKUP
- **PM_WKDEP_USBHOST**: The USBHOST power domain has programmable wake-up dependency with the following domains:
 - MPU
 - IVA2
 - WKUP
 - CORE

There is no wake-up dependency control for the WKUP power domain, because it is always on.

Because the CORE power domain wake-up dependencies are not programmable, the CORE power domain always wakes up on a wake-up event on the following domains:

- MPU
- IVA2
- WKUP
- CAM
- DSS
- SGX
- PER
- USBHOST

4.12.2.5.4 **PM_ <processor_name> GRPSEL_ <domain_name> (Processor Group Selection Register)**

The processor group selection register allows defining the group of modules in the domain that can wake up a processor domain (MPU or IVA2). This bit is effective only if the module wake-up capability is enabled (PM_WKEN_<domain_name> register).

The device has the following processor group selection registers:

- **PM_MPUGRPSEL1_CORE** and **PM_MPUGRPSEL3_CORE**: CORE power domain modules MPU wake-up control
- **PM_IVA2GRPSEL1_CORE** and **PM_IVA2GRPSEL3_CORE**: CORE power domain modules IVA2 wake-up control
- **PM_MPUGRPSEL_PER**: PER power domain modules MPU wake-up control
- **PM_IVA2GRPSEL_PER**: PER power domain modules IVA2 wake-up control
- **PM_MPUGRPSEL_WKUP**: WKUP power domain modules MPU wake-up control
- **PM_IVA2GRPSEL_WKUP**: WKUP power domain modules IVA2 wake-up control

- [PM_MPUGRPSEL_USBHOST](#): HS USB Host subsystem MPU wake-up control
- [PM_IVA2GRPSEL_USBHOST](#): HS USB Host subsystem IVA2 wake-up control

NOTE: The wake-up capability of the DSS is always attached to the MPU group; it cannot be attached to the IVA2.2, and therefore is not programmable.

4.12.3 Reset Management Registers

4.12.3.1 Reset Control

4.12.3.1.1 PRM_RSTTIME (Reset Time Register)

The reset time register provides control over reset duration. Two durations are configurable:

- **RSTTIME1:** Minimum duration (by default, two cycles of the 32-kHz clock) of the global warm reset (sys_nreswarm) assertion for external devices, such as flash memories. At power-up reset, DPLLs are reset and the power domains are switched on and stabilized during this duration.
- **RSTTIME2:** Minimum duration (by default, 16 cycles of the RM_ICLK clock) to control power domain resets when the domain clocks are on.

For global cold and warm resets, the reset is applied for the RSTTIME1 + RSTTIME2 duration. In the other cases, when a power domain individually goes from off to active, the reset is applied only for the RSTTIME2 duration (plus the power domain wake-up duration).

RSTTIME1 and RSTTIME2 can be reprogrammed for different behavior after the initial power up.

4.12.3.1.2 RM_RSTCTRL_ <domain_name> (Reset Control Register)

The reset control register provides control over the local domain software reset.

Most device modules include an individual software reset that can be controlled using the related module SYS_CONFIG register.

The RM_RSTCTRL_<domain_name> register is used for specific subsystems or modules that do not support this local reset or that require a specific system control (the IVA2.2 subsystem).

The [PRM_RSTCTRL](#) register also handles the global software warm reset control.

The device includes the following reset control registers:

- [PRM_RSTCTRL](#): This register allows control of the assertion of the global software reset and the DPLL3 software reset. These bits are automatically cleared. Assertion of the DPLL3 software reset triggers a device global cold reset. The reset condition of this register depends on the bit field:
 - The RST_GS bit is set on any global source of reset (warm or cold).
 - The RST_DPLL3 bit is set only on a global cold source of reset.
- [RM_RSTCTRL_IVA2](#): IVA2 power domain software resets the IVA2.2 and SEQ subsystems. Both subsystems are held under reset after power up and are released by software. The SEQ software reset bit is reset to 1 (SEQ reset active) on an IVA2 domain power transition from off or retention to on.

4.12.3.1.3 RM_RSTST_ <domain_name> (Reset Status Register)

The reset status register logs any source that has generated a reset in the related power domain. Depending on the domain, several causes of reset can be logged:

- Global device cold reset
- Global device warm reset
- Power domain transition (off to active, and inactive to active)
- Software reset
- Processor emulation reset

The [PRM_RSTST](#) register logs the source of the global reset:

- VDD1/VDD2 voltage manager reset
- External warm reset
- MPU watchdog reset
- Global software reset and DPLL3 software reset
- Global cold reset

The device includes the following reset status registers:

- [RM_RSTST_MPU](#)
- [RM_RSTST_CORE](#)
- [RM_RSTST_DSS](#)
- [RM_RSTST_CAM](#)
- [RM_RSTST_IVA2](#)
- [RM_RSTST_PER](#)
- [RM_RSTST_NEON](#)
- [RM_RSTST_SGX](#)
- [RM_RSTST_EMU](#)
- [PRM_RSTST](#)
- [RM_RSTST_USBHOST](#)

Only the [RM_RSTST_CORE](#), [RM_RSTST_IVA2](#), and [PRM_RSTST](#) registers log software sources of reset.

Each bit of these registers is set on the effective release of the respective reset signal.

4.12.4 Power Management Registers

4.12.4.1 PM_PWSTCTRL_ <domain_name> (Power State Control Register)

The power state control register allows controlling the power state transition of the domain.

This register holds the following bit fields:

- **POWERSTATE**: Power state (ON, retention, or off) to be applied for the next transition
- **LOGICRETSTATE**: Logic is retained or switched off when the domain goes into retention. This feature is domain-dependent and is not necessarily programmable (read only).
- **MEMRETSTATE[1 to X]**: Memory block *i* is retained (RAM state retained) or switched off (RAM state not retained) when the domain goes into retention. This feature is domain-dependent and is not necessarily programmable (read only).
- **MEMONSTATE[1 to X]**: Memory block *i* in the domain is on (RAM active), retained (RAM inactive but state retained) or switched off (RAM state not retained) when the domain is on. This feature is domain-dependent and is not necessarily programmable (read only).
- **MEMORYCHANGE**: Allows updating the memory state according to latest MEMONSTATE[1 to X] setting.

The device has the following power state control registers:

- [PM_PWSTCTRL_MPU](#): MPU domain power management
- [PM_PWSTCTRL_CORE](#): CORE domain power management
- [PM_PWSTCTRL_SGX](#): SGX domain power management
- [PM_PWSTCTRL_DSS](#): DSS domain power management
- [PM_PWSTCTRL_CAM](#): CAM domain power management
- [PM_PWSTCTRL_PER](#): PER domain power management
- [PM_PWSTCTRL_NEON](#): NEON domain power management
- [PM_PWSTCTRL_IVA2](#): IVA2 domain power management
- [PM_PWSTCTRL_USBHOST](#): USBHOST domain power management

MPU domain power management has the following features:

- The power state is programmable to on, retention, and off states.
- Logic and L1 cache state are switchable to off and retention states when the power domain is in retention state.
- L2 cache state is switchable to off and retention states when the power domain is in retention state.
- L2 cache state is switchable to off and on states when the power domain is in on state.
- L2 cache state can be switched dynamically when the domain state is on (no power transition is required).
- The L1 cache is always on when the power domain state is on.

CORE domain power management has the following features:

- The power state is programmable to on, retention, or off states.
- Nonretained logic is switchable to off and retention states when the power domain is in retention state.
- Memory bank 1 and 2 states are switchable to off and retention states when the power domain is in retention state.
- Memory bank 1 and 2 states are switchable to off, retention, and on states when the power domain is in on state.
- Memory bank 1 and 2 states can be switched dynamically when the domain state is on (no power transition is required).

SGX domain power management has the following features:

- The power state is programmable to on, retention, and off states.
- The logic is always in retention state when the power domain is in retention state.
- The memory is always in retention state when the power domain is in retention state.
- The memory is always in on state when the power domain is in on state.

DSS domain power management has the following features:

- The power state is programmable to on, retention, and off states.
- The logic is always in retention state when the power domain is in retention state.
- The memory is always in retention state when the power domain is in retention state.
- The memory is always in on state when the power domain is in on state.

CAM domain power management has the following features:

- The power state is programmable to on, retention, and off states.
- The logic is always in retention state when the power domain is in retention state.
- The memory is always in retention state when the power domain is in retention state.
- The memory is always in on state when the power domain is in on state.

PER domain power management has the following features:

- The power state is programmable to on, retention, and off states.
- The logic is always in retention state when the power domain is in retention state.

NEON domain power management has the following features:

- The power state is programmable to on, retention, and off states.
- The logic is always in retention state when the power domain is in retention state.

IVA2 domain power management has the following features:

- The power state is programmable to on, retention, and off states.
- Logic state is switchable to off and retention states when the power domain is in retention state.
- L1 cache state is switchable to off and retention states when the power domain is in retention state.
- L1 flat memory state is switchable to off and retention states when the power domain is in retention state.
- L2 cache state is switchable to off and retention states when the power domain is in retention state.
- L2 flat memory state is switchable to off and retention states when the power domain is in retention state.
- L1 cache state is always on when the power domain is in on state.
- L1 flat memory state is always on when the power domain is in on state.
- L2 cache state is switchable to off and on states when the power domain is in on state.
- L2 flat memory state is always on when the power domain is in on state.
- L2 cache memory state can be switched dynamically to off state and back to on state when the domain state is on (no domain power transition is required).

USBHOST domain power management has the following features:

- The power state is programmable to on, retention, and off states.
- The logic is always in retention state when the power domain is in retention state.
- The memory is always in retention state when the power domain is in retention state, and the memory is always on when the power domain is in on state.

The EMU power state is not programmable. The EMU domain is always powered down when the software or hardware conditions that allow a power transition are met. Thus, the EMU domain is automatically powered down after the power-up sequence if no emulation hardware is connected.

NOTE: The L1 cache memory bank can be configured to be either entirely or partially cache or flat memory. This configuration is done in the IVA2.2 subsystem. The part that is configured as cache memory can be retained; however, because tag and validity bit information are not retained in the case of L1 cache, this part cannot be retrieved after wakeup. It is important to configure the L1 cache memory state with a consistent value depending on the chosen configuration when the domain is in retention state:

- If the L1 cache memory bank is entirely configured as cache memory, set the [PM_PWSTCTRL_IVA2\[8\]](#) SHAREDL1CACHEFLATRETSTATE bit to the same value as the [PM_PWSTCTRL_IVA2\[2\]](#) LOGICRETSTATE bit.
- If the L1 cache memory bank is entirely or partially configured as flat memory, set the [PM_PWSTCTRL_IVA2\[8\]](#) SHAREDL1CACHEFLATRETSTATE bit to the same value as the [PM_PWSTCTRL_IVA2\[9\]](#) L1FLATMEMRETSTATE bit.

The same mechanism applies to the L2 cache memory bank.

Because the L2 cache may not be useful in a system when the DSP frequency and interconnect frequencies are in the same range, this memory bank can be switched off when the domain is on.

4.12.4.2 PM_PWSTST_ <domain_name> (Power State Status Register)

The power state status register provides the status of the power state transition of the domain.

This register holds the following bit fields:

- **POWERSTATESTATUS:** Indicates the current power state of the domain (on, retention, off)
- **LOGICSTATESTATUS:** Indicates the current logic power state
- **MEMORYSTATESTATUS:** Indicates the current memory power state
- **INTRANSITION:** Indicates an ongoing power state transition from ON power state to inactive, off, or retention, and from inactive, off, or retention power states to on power state

The memory power state is updated by performing a dynamic memory change (the [PM_PWSTCTRL_<domain_name> MEMORYCHANGE](#) bit). Software clears the [PM_PREPWST_<domain_name>](#) register (this forces a memory change to the same value).

The device has the following power state status registers:

- [PM_PWSTST_MPU](#): MPU domain power state status
- [PM_PWSTST_CORE](#): CORE domain power state status
- [PM_PWSTST_SGX](#): SGX domain power state status
- [PM_PWSTST_DSS](#): DSS domain power state status
- [PM_PWSTST_CAM](#): CAM domain power state status
- [PM_PWSTST_PER](#): PER domain power state status
- [PM_PWSTST_NEON](#): NEON domain power state status
- [PM_PWSTST_EMU](#): EMU domain power state status
- [PM_PWSTST_IVA2](#): IVA2 domain power state status
- [PM_PWSTST_USBHOST](#): USBHOST domain power state status

The MPU domain power state status register indicates the current domain, logic, L1 cache (on or off), and L2 cache (on, retention, or off) power state.

The CORE domain power state status register indicates the current domain, logic (on or off), and memory banks 1 and 2 (on, retention, or off) power state.

The SGX, DSS, CAM, PER, NEON, USBHOST, and EMU domain power state status registers indicate the current domain (on, inactive, retention, or off) power state or that the power domain transition is in progress. Because the SGX memory state is not programmable and reflects the power state, the SGX power domain does not require a memory power state.

The IVA2 domain power state status register indicates the current domain (on, inactive, retention, or off), logic (on or off), L1 cache and flat memory (on, retention, or off), L2 cache and flat memory (on, retention, or off) power state status.

4.12.4.3 PM_PREPWSTST_<domain_name> (Previous Power State Status Register)

The previous power state status register indicates the power state entered during the last sleep transition. The information in this register is useful when the domain switches back to on state (following a wake-up transition). This register must only be read when the domain power state is on.

This register has the following bit fields:

- **LASTPOWERSTATEENTERED**: Last domain power state entered after the last sleep transition
- **LASTLOGICSTATEENTERED**: Last logic power state entered after the last sleep transition
- **LASTMEMORYSTATEENTERED**: Last memory power state entered after the last sleep transition or before the last memory change update

The device has the following previous power state status registers:

- **PM_PREPWSTST_MPU**: The MPU power domain previous power state status
- **PM_PREPWSTST_CORE**: The CORE power domain previous power state status
- **PM_PREPWSTST_SGX**: The SGX power domain previous power state status
- **PM_PREPWSTST_DSS**: The DSS power domain previous power state status
- **PM_PREPWSTST_CAM**: The CAM power domain previous power state status
- **PM_PREPWSTST_PER**: The PER power domain previous power state status
- **PM_PREPWSTST_NEON**: The NEON power domain previous power state status
- **PM_PREPWSTST_IVA2**: The IVA2 power domain previous power state status
- **PM_PREPWSTST_USBHOST**: The USBHOST power domain previous power state status

The previous power state status register for the MPU power domain indicates the previous domain, logic, L1 cache (on or off), and L2 cache (on, retention, or off) power state.

The previous power state status register for the CORE power domain indicates the previous domain, logic (on or off), and memory banks 1 and 2 (on, retention, or off) power state.

The previous power state status registers for the SGX, DSS, CAM, PER, NEON, USBHOST and EMU power domains indicate the previous domain (on, inactive, retention, or off) power state. The SGX power domain does not require a memory power state status, because the SGX memory state is not programmable and reflects the power state.

The previous power state status register for the IVA2 power domain indicates the previous domain (on, inactive, retention, or off), logic (on or off), L1 cache and flat memory (on, retention, or off), and L2 cache and flat memory (on, retention, or off) power state status.

The current memory state depends on the setting of the PM_PWSTCTRL_<domain_name> MEMONSTATE bit during the last wake-up transition or during the last memory change operation.

This register must be cleared by software by writing any value to it; this operation must be done when the domain power state is on. Clearing this register does the following:

- Resets the PM_PREPWSTST_<domain_name> LASTPOWERSTATEENTERED bit field and the PM_PREPWSTST_<domain_name> LASTLOGICSTATEENTERED bit to the on state
- Sets the bit fields corresponding to the last memory state of the power domain to the current memory state

NOTE: Performing a memory change (the PM_PWSTCTRL_<domain_name>[3] MEMORYCHANGE bit for MPU, IVA2, and CORE) has the same effect as clearing this register.

4.12.5 Voltage Management Registers

4.12.5.1 External Voltage Control Register Descriptions

4.12.5.1.1 PRM_VOLTSETUP (Voltage Setup Time Register)

The device has two voltage setup registers:

- [PRM_VOLTSETUP1](#)
- [PRM_VOLTSETUP2](#)

These registers allow controlling the setup time of the VDD1 and VDD2 power supplies when the device exits the off mode or when the voltage is scaled. It is a constant value that depends on the connected power IC. At power-up reset, this register is not used, because the external power supply is already stable. After boot up, the software must set the correct value to ensure proper sequences when performing voltage scaling or sleep transitions.

The [PRM_VOLTSETUP1](#) register has the following bit fields:

- **SETUPTIME1**: The setup time of the VDD1 regulator. It is computed as 8 x NbCycles (number of cycles of the system clock), where NbCycles is configured in the register bit field.
- **SETUPTIME2**: The setup time of the VDD2 regulator. It is computed as 8 x NbCycles (number of cycles of the system clock), where NbCycles is configured in the register bit field.

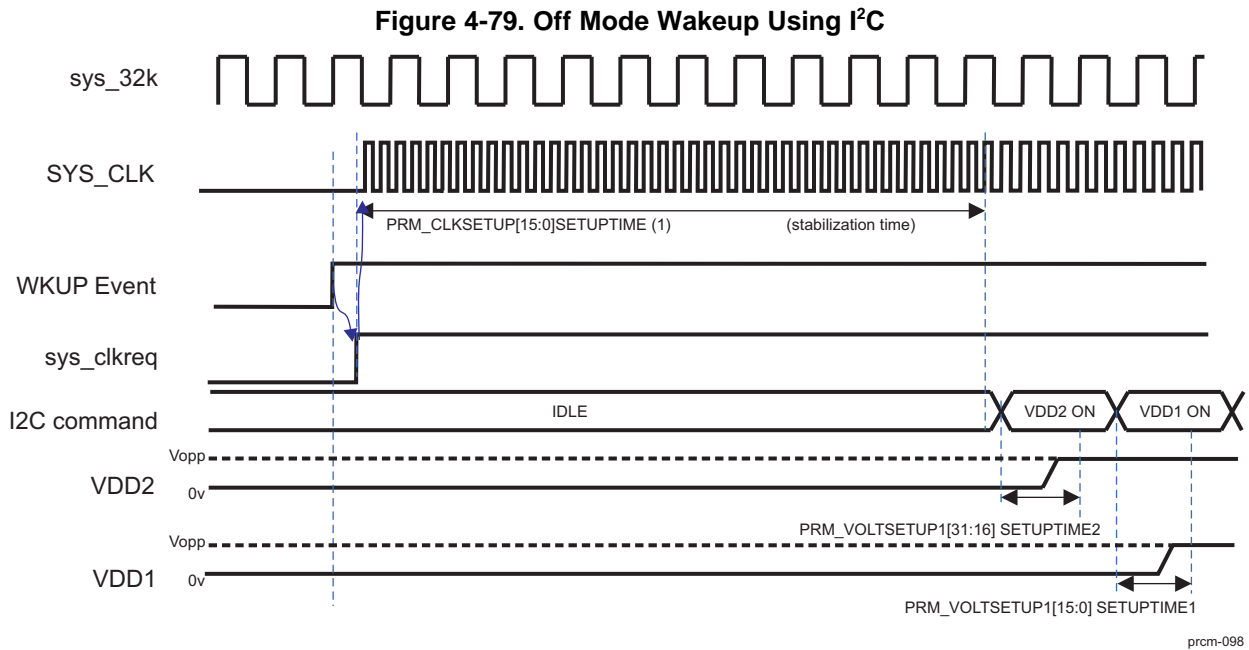

The [PRM_VOLTSETUP1](#) register is used when the device exits off/retention/sleep mode (or enters off/retention/sleep mode) and manages the sequencing of the voltage regulation steps (the [PRM_VOLTCTRL](#)[3] SEL_OFF bit is set to 0).

The [PRM_VOLTSETUP2](#) register has the following bit field:

- **OFFMODESETUPTIME**: The number of 32-kHz clock cycles for the overall setup time of the power management IC when coming back from off mode (VDD1, VDD2, VDD_PLL,..)

The [PRM_VOLTSETUP2](#) register is used only when the device exits off mode and an external power IC manages the sequencing of the voltage regulation steps ([PRM_VOLTCTRL](#)[3] SEL_OFF is set to 1).

[Figure 4-79](#) shows off mode wakeup using I²C.

- (1) [PRM_VOLTSETUP1](#)[31:16] SETUPTIME2 and [PRM_VOLTSETUP1](#)[15:0] SETUPTIME1 are not used during voltage scaling (between different OPPs).

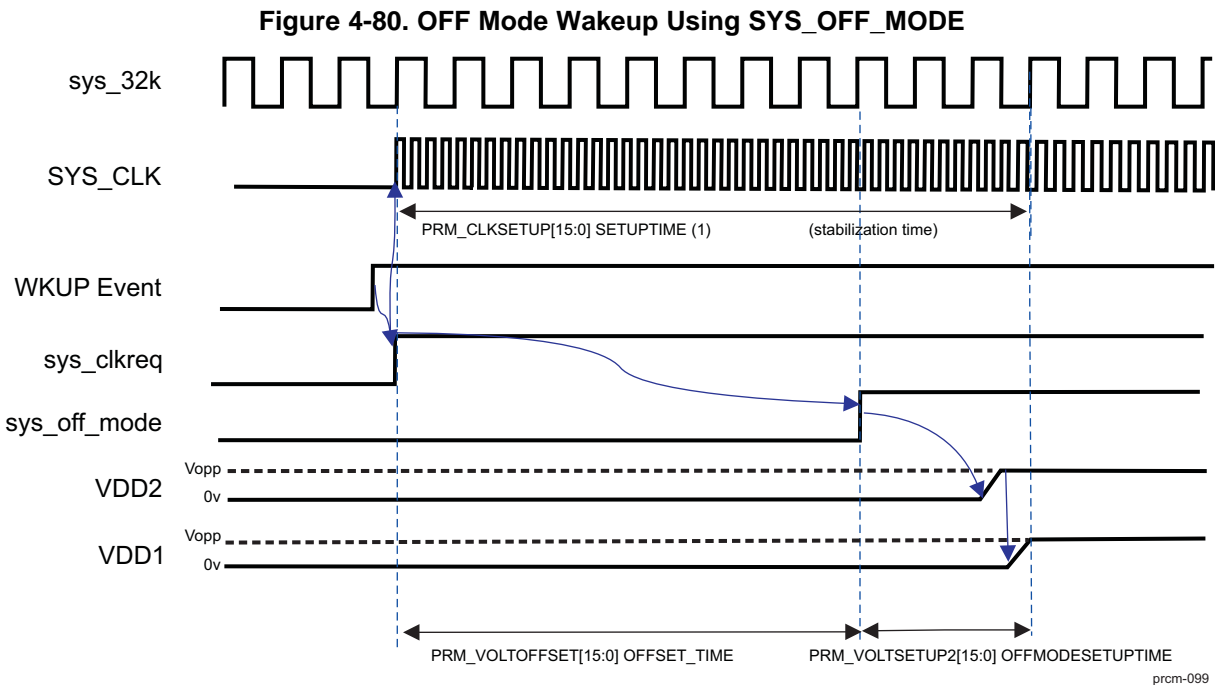

4.12.5.1.2 [PRM_VOLTOFFSET](#) (Voltage Offset Register)

This register allows setting the offset time, which is the time duration between the assertion of sys_clkreq and the deassertion of sys_off_mode when the device is exiting off mode. This time, set as a number of 32-kHz clock cycles, is used to delay the deassertion of sys_off_mode (and as a consequence, the voltage ramping) after the clock has been requested. This is done to avoid waiting for the clock to stabilize when the voltage is already ramped and stabilized, which would induce some leakage.

Program this bit field to match the following equation: $PRM_VOLTOFFSET[15:0] \text{ OFFSET_TIME} = PRM_CLKSETUP[15:0] \text{ SETUPTIME} - PRM_VOLTSETUP2[15:0] \text{ OFFMODESETUPTIME}$. This way, the voltages and clock are ready at the same time.

This register is used on device wakeup from off mode when the off sequence is supervised by the power IC.

Figure 4-80 shows off mode wakeup using SYS_OFF_MODE.

(1) $PRM_CLKSETUP[15:0] \text{ SETUPTIME}$ is not used during device cold boot-up sequence.

4.12.5.1.3 *PRM_VOLTCTRL (Voltage Source Control Register)*

This register allows control of the power IC. The following are the register bit fields:

- **AUTO_SLEEP:** Automatically sends the sleep command when the voltage domain is in the appropriate standby mode
- **AUTO_RET:** Automatically sends the retention command when the voltage domain is in the appropriate standby mode
- **AUTO_OFF:** Automatically sends the off command when the voltage domain is in the appropriate standby mode
- **SEL_OFF:** Controls whether the off command is sent through the voltage controller I²C interface or the signal sys_off_mode is asserted when entering off mode
- **SEL_VMODE:** Allows control of the power IC through either the voltage controller I²C interface or the VMODE interface

NOTE: It is mandatory to program the AUTO_SLEEP, AUTO_RET, and AUTO_OFF bit fields in an exclusive manner.

4.12.5.2 Voltage Controller Registers

A specific set of registers allows control of the voltage controller. This register set provides programming flexibility to address different power IC device types through an I²C interface.

The register set is composed of the following registers:

- Registers to store the addresses on the I²C bus:

- [PRM_VC_SMPS_SA](#)
- [PRM_VC_SMPS_VOL_RA](#)
- [PRM_VC_SMPS_CMD_RA](#)
- Registers to store the voltage values or voltage commands:
 - [PRM_VC_CMD_VAL_0](#)
 - [PRM_VC_CMD_VAL_1](#)
- Register to configure the VDD channel:
 - [PRM_VC_CH_CONF](#)
- Register to configure the I²C interface:
 - [PRM_VC_I2C_CFG](#)
- Register to use the bypass command:
 - [PRM_VC_BYPASS_VAL](#)

4.12.5.2.1 ***PRM_VC_SMPS_SA (Voltage Controller SMPS Slave Address Register)***

This register stores the I²C slave address value of the power IC device. Two address values can be stored in case two different power IC chips are used to control the two VDD channels (VDD1 and VDD2).

4.12.5.2.2 ***PRM_VC_SMPS_VOL_RA (Voltage Controller SMPS Voltage Register Address Register)***

This register stores the address value of the voltage configuration registers in the power IC device. Two different register address values can be configured.

4.12.5.2.3 ***PRM_VC_SMPS_CMD_RA (Voltage Controller SMPS Command Register Address Register)***

This register stores the address value of the command configuration register in the power IC device. Two different register address values can be configured.

4.12.5.2.4 ***PRM_VC_CMD_VAL_0 and PRM_VC_CMD_VAL_1 (Voltage Controller Command and Voltage Value Register 0 and 1)***

The voltage controller can store two sets of voltage-level commands for each of the four power states (on, low power, retention, and off) for the power IC. The voltage commands depend on the power IC device used.

4.12.5.2.5 ***PRM_VC_CH_CONF (Voltage Controller Channel Configuration Register)***

This register consists of a set of select bits for the VDD1 and VDD2 channels, the slave address, command register address, voltage register address, and voltage-level command settings for power modes (on/low power, on/retention/off). A pair of bit fields can be configured for each of these parameters. The [PRM_VC_CH_CONF](#) register allows the allocation of either of the two bit fields (for each of these parameters) to each voltage channel (VDD1 and VDD2). For example, when `PRCM.PRM_VC_CH_CONF[0] SA0 = 0x1`, the voltage controller allocates `PRCM.PRM_VC_SMPS_SA[22:16] SA1` as the slave address for the VDD1 channel. When `PRCM.PRM_VC_CH_CONF[0] SA0 = 0x0`, the voltage controller allocates `PRCM.PRM_VC_SMPS_SA[6:0] SA0` as the slave address for the VDD1 channel.

4.12.5.2.6 ***PRM_VC_I2C_CFG (Voltage Controller I²C Interface Configuration Register)***

This register allows the setting of the I²C interface configuration parameters:

- Master code value when I²C interface is used in HS mode
- Enable and disable the HS mode
- Enable and disable the repeated start-operation mode
- Enable and disable the HSMaster mode

4.12.5.2.7 PRM_VC_BYPASS_VAL (Voltage Controller Bypass Command Register)

This register is used to address directly the power IC device through the I²C interface. It has the following bit fields:

- SLAVEADDR: Slave address value of the I²C interface of the power IC device (similar to [PRM_VC_SMPS_SA](#))
- REGADDR: Address of the command or voltage value register of the power IC device (similar to [PRM_VC_SMPS_VOL_RA](#) or [PRM_VC_SMPS_CMD_RA](#))
- DATA: Data to be written to the command or voltage value register
- VALID: Voltage command transaction enable and acknowledge bit

4.12.6 Generic Programming Examples

4.12.6.1 Clock Control

The module clock management is controlled through three programmable steps:

- Enabling or disabling the functional clocks
- Enabling or disabling the interface clocks
- Enabling or disabling the automatic idle mode for the interface clocks

4.12.6.1.1 Enabling and Disabling the Functional Clocks

The flow chart in [Figure 4-81](#) shows how to enable or disable a functional clock.

The first step before enabling a functional clock is to select the proper source clock using the corresponding clock selection register (CM_CLKSEL_<domain_name>). It can be either an external source clock or an internal clock; that is, sys_altclk or DPLL4_M3X2_CLK for the DSS_TV_FCLK functional clock of the DSS.

If the source clock is a DPLL3 or DPLL4 output clock, the DPLL multiplier, divider, and output clock ratios are set in the CM_CLKSELn_PLL register, where n is from 1 to 3. The DPLL operating mode is set in the [CM_CLKEN_PLL](#) register.

The functional clock is enabled or disabled by writing the dedicated bit in the CM_FCLKEN_<domain_name> register. This bit has a direct effect on the clock activity:

- The functional clock is turned on if the bit is enabled and the clock is not yet active.
- The functional clock is turned off if the bit is disabled and the clock is not required by any other module.

Figure 4-81. Functional Clock Basic Programming Model

* Clock domain Idle conditions are:
 a. No other module sharing the same clock domain needs the clock.
 (All modules of the clock domain are idled)
 b. No wake-up event.

prcm-085

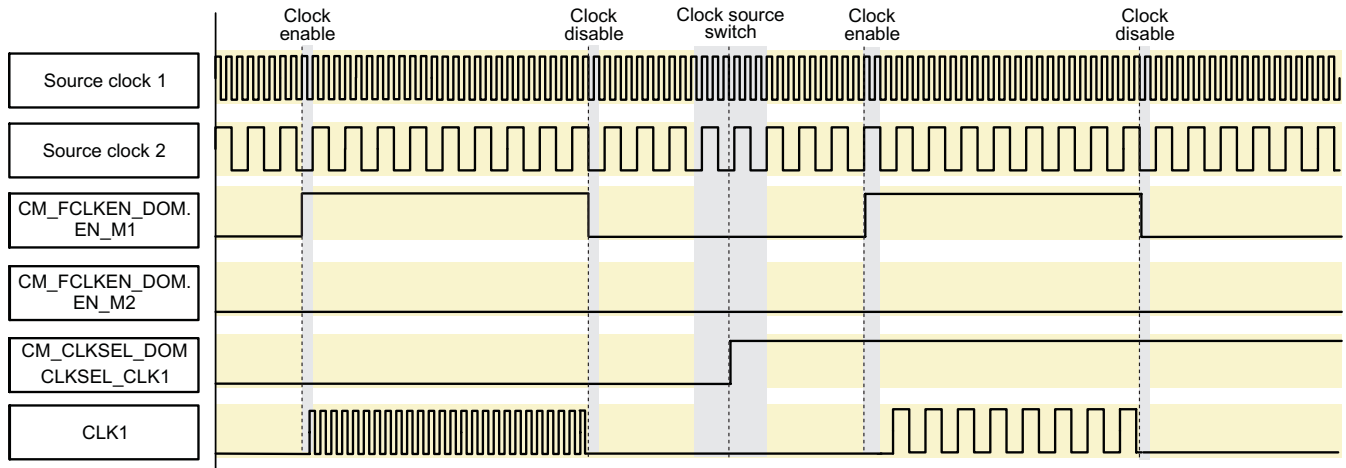

The functional clock must be disabled before switching or scaling its source clock. This means that all the modules using the particular functional clock must not be active during clock switching. To switch a source clock, perform the following sequence:

1. Disable the functional clock by setting the CM_FCLKEN_<power domain>EN_<module> bits to 0.
2. Modify the CM_CLKSEL_<power domain>CLKSEL_<clock> bits to select the new clock source or clock divider.
3. Enable the functional clock by setting the CM_FCLKEN_<power domain>EN_<module> bits to 1.

The timing diagram in Figure 4-82 is a generic example of this sequencing for a functional clock (CLK1). The source clock can be switched between source clock 1 and source clock 2 using the CM_CLKSEL_DOM.CLKSEL_CLK1 bit (source clock 1 is selected when the bit is set to 0; otherwise, source clock 2 is selected). CLK1 can be requested by two modules, M1 and M2. The CM_FCLKEN_DOM.EN_M1 and CM_FCLKEN_DOM.EN_M2 bits control the functional clock enable for the two modules.

NOTE: The activation or deactivation of the clock is implementation-dependent, not one cycle of the source clock, as shown in Figure 4-82.

Figure 4-82. Functional Clock Switching

prcm-080

The following functional clocks require this switching sequence:

- sys_clkout2
- 48M_FCLK (and all gated versions of it)
- 12M_FCLK (and all gated versions of it)
- DSS_TV_CLK
- GPTx_FCLK (with x = 1, 10, and 11)
- GPTx_ALWON_FCLK (with x = 2 up to 9)

4.12.6.1.2 Enabling and Disabling the Interface Clocks

The flow chart in [Figure 4-83](#) shows the enable/disable sequence of the interface clock.

The first step before enabling an interface clock is to select the proper source clock using the corresponding clock selection register (CM_CLKSEL_<domain>). This register allows selection of the interconnect frequency (L3_ICLK, L4_ICLK) from among several divider ratios.

The interface clock is enabled or disabled by writing the dedicated bit in the CM_ICLKEN_<domain> register. This bit has a direct effect on the clock activity:

- The interface clock is turned on if the bit is enabled and the clock is not yet active.
- The interface clock is turned off if the bit is disabled and the clock is not required by any other module.

The interface clock can be automatically enabled or disabled by the PRCM module, based on hardware conditions. This automatic clock activity control mode is enabled by writing the corresponding bit in the CM_AUTOIDLE_<domain > register. It takes effect only if the interface clock is enabled (the corresponding bit in the CM_ICLKEN_<domain > is set to 1).

The hardware conditions for automatic gating (deactivation) of the clock are as follows:

- The module activity; that is, the module is inactive.
- The domain activity; that is, all modules in the domain are inactive.

The software can read the idle status register CM_IDLESTAT_<domain> at any time to know whether the module is accessible. A module is inaccessible if its idle status bit is set. Accessing an idle module generates an error (if the interface clock is still running) or a time-out (if the interface clock is cut).

Figure 4-83. Interface Clock Basic Programming Model

prcm-086

The frequency ratio between the CORE_CLK, the L3_ICLK, and the L4_ICLK is configured by setting the corresponding **CM_CLKSEL_CORE** register bit fields. This configuration must be done before switching DPLL3 to lock mode. In this way, the clock ratio is switched while DPLL3 is operating at system clock frequency, and then only DPLL3 is switched to high-frequency locked mode.

If the configuration of the interface clock needs to be changed, first put DPLL3 in bypass mode, select the new configuration, and then relock DPLL3.

NOTE: When performing frequency scaling, the clock division can be done directly by programming the DPLL output divider. In this case, there is no need to change the configuration of the interface clock.

4.12.6.1.3 Enabling and Disabling the Inactive State

The flow chart in [Figure 4-84](#) shows how to put a domain into inactive state. This state is required before any power transition from on state to retention or off state.

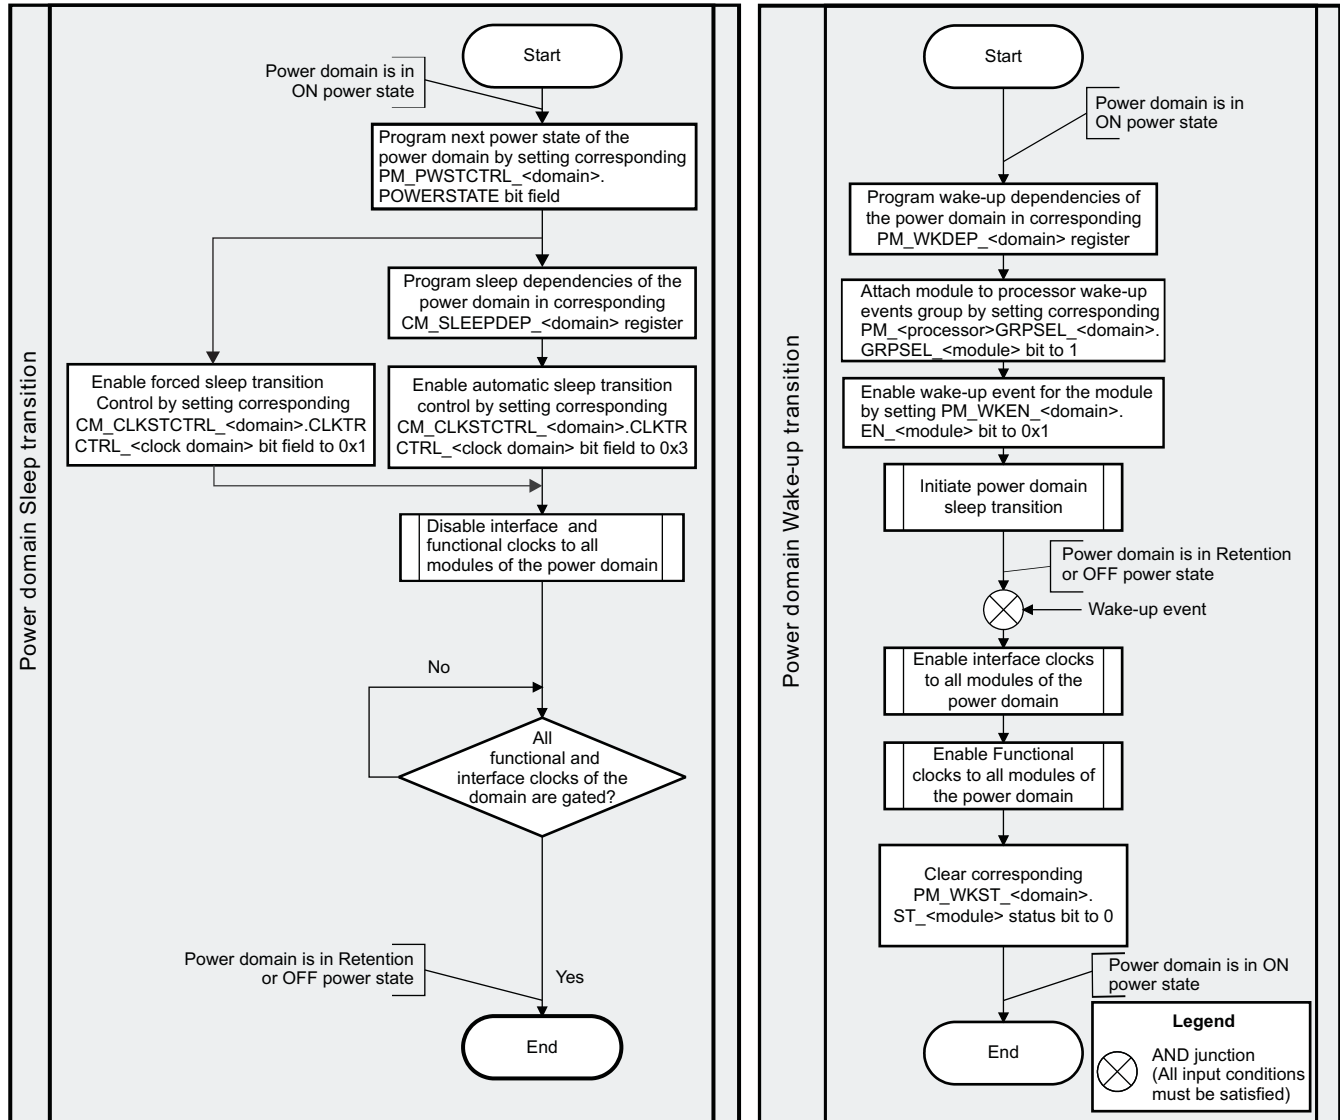

A domain is said to be in inactive state if:

- All the functional and interface clocks of the domain are gated (deactivated).
- All the initiator modules are in standby mode.
- All the dependent domains have reached their mute state. The sleep dependency between the power domains is configured by programming the **CM_SLEEPDEP_<domain>** register.

The domain transition from active state to inactive state is effective only if the **CM_CLKSTCTRL_<domain>** register is programmed for hardware-supervised state transition.

The CM_CLKSTST_<domain> register identifies whether a power domain or a clock domain within the power domain is accessible. A domain is inaccessible if its corresponding bit in the CM_CLKSTST_<domain > register is set to 1.

Figure 4-84. Domain Inactive STATE Basic Programming Model

prcm-087

4.12.6.1.4 Processor Clock Control

The flow chart in Figure 4-85 shows the control sequence of the processor clock.

The processor source clock is generated by the dedicated processor DPLL (DPLL1 and DPLL2). After power up, the processor DPLL is in bypass or stop mode. This means the processor clock is either the system clock or is shut off.

The first step is to program the multiplier and divider ratios of the processor DPLL. Those two values are written in the CM_CLKSEL1_PLL_<processor> register.

For frequency scaling, the processor DPLL integrates an additional divider to scale down the synthesized clock. The value of this second divider is written in the CM_CLKSEL2_PLL_<processor> register. This divider can be configured dynamically (while the processor executes instructions), and the DPLL output clock is scaled without any glitches.

The processor DPLL must be locked at a desired frequency, provided the clock frequency is higher than the system clock. It can then be set to low-power bypass mode when the high-frequency clock is not required. The DPLL operating mode (locked or bypassed) is controlled by programming the `CM_CLKEN_PLL_<processor>` register.

The processor clock can be switched automatically, based on hardware conditions, between the processor DPLL synthesized clock and a bypass clock. This mode is enabled by programming the corresponding mode in the `CM_AUTOIDLE_PLL_<processor>` register. It takes effect only if the processor DPLL is locked (the `CM_CLKEN_PLL_<processor>` register is set in lock mode).

The HS bypass clock for the processor DPLL can be:

- The DPLL3 output clock (`CORE_CLK`)
- The DPLL3 output clock (`CORE_CLK`) divided by 2

The HS bypass clock is selected by programming the `CM_CLKSEL1_PLL_<processor>` register.

The software can read the `CM_IDLEST_PLL_<processor>` register at any time to determine whether the DPLL is in lock mode (DPLL output is a high-frequency synthesized clock) or bypass mode (DPLL output is not the synthesized clock; the DPLL output is the bypass clock, or the DPLL is in transitioning state).

4.12.6.2 Reset Management

The reset sequence is hardware-driven. On power on, once all the reset sources have been released, the PRCM holds the entire device under reset long enough to ensure the stabilization of the power IC voltages and the oscillator system clock frequency. This reset delay is programmed in the [PRM_RSTTIME](#) register.

The IVA2.2 and the modem domain resets are held active after power up. They are released by writing to the corresponding bits in the [RM_RSTCTRL_<domain>](#) register.

A domain reset status register ([PRM_RSTST_<domain>](#)) identifies the source of the current reset applied to the domain. The software must clear this status bit after reset.

A global reset status register ([PRM_RSTST](#)) provides information about the global source of resets. All sources of warm reset are logged separately in this register, and all sources of cold reset are logged in a common status bit.

4.12.6.3 Wake-Up Control

The flow chart in [Figure 4-86](#) shows the control sequence of the module wake-up event.

This procedure consists of the following steps:

1. Program the PRCM module to consider the wake-up event.
2. Switch to idle mode and wait for the wake-up event.
3. Wake up on the wake-up event and activate the module functional clock.
4. Acknowledge the wake-up event.

The peripheral that can generate a wake-up event must be attached to a group of wake-up event generating modules for one or both processors by programming the [PM_<processor>GRPSEL](#) register. Writing 1 to this register allows the corresponding processor to be wakened on a peripheral wake-up event, assuming that the peripheral wake-up capability has been enabled by programming the register [PM_WKEN_<domain>](#).

After this is configured, the PRCM module initiates a wake-up procedure on receiving the peripheral wake-up event. The peripheral functional clock must be reenabled by programming the [CM_FCLKEN_<domain >](#) register, and then the wake-up event can be acknowledged by clearing the [PM_WKST_<domain >](#) register.

Figure 4-86. Wake-up Basic Programming Model

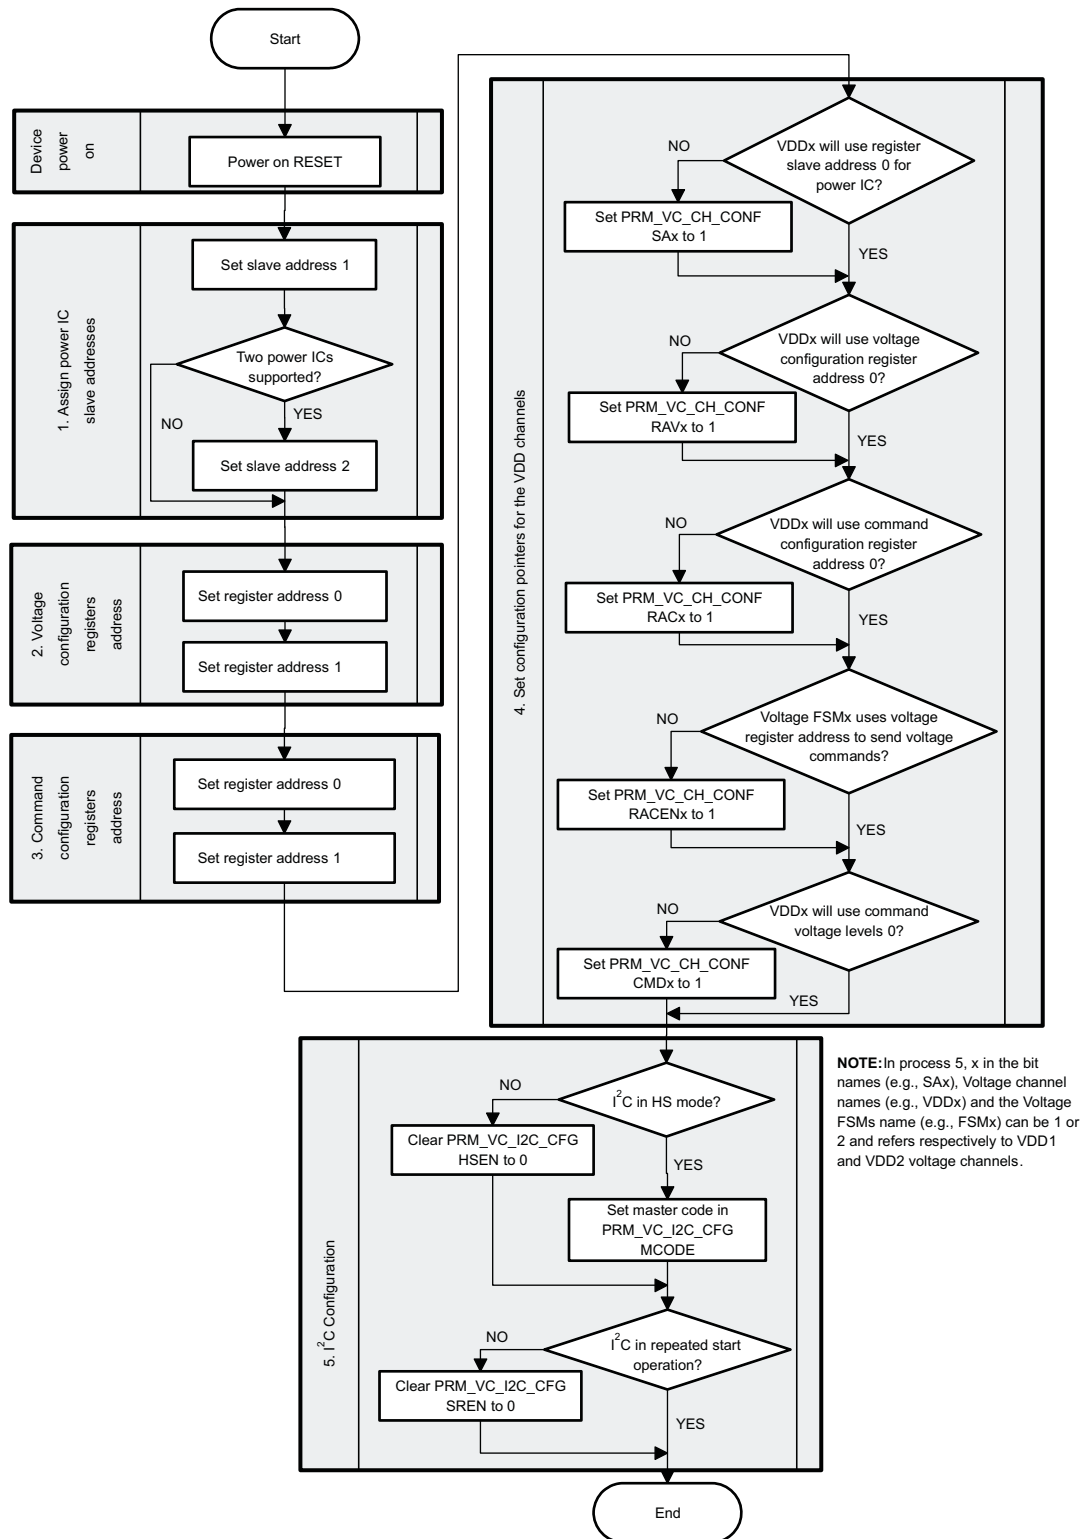

prcm-084

A power domain A can have a functional dependency on a power domain B. Thus, when power domain A wakes up, it may be necessary to wake up power domain B. This wake-up dependency is hardcoded for the CORE power domain, but is programmable for the other power domains through the PM_WKDEP_<domain> register.

4.12.6.4 Voltage Controller Initialization Basic Programming Model

Figure 4-87 is the flow chart for voltage controller initialization.

Figure 4-87. Voltage Controller Initialization Flow Chart

prcm-UC-008

1. Assign power IC slave addresses.

To support the I²C communication with external power ICs, the slave address of the power ICs must be configured in the voltage controller registers. The voltage controller can support two slave addresses to control VDD1 and VDD2 independently, from two different power ICs. At least one valid slave address is required to communicate with a power IC.

NOTE: The slave address for the following depends on the configured slave address of the power IC:

- PRCM.PRM_VC_SMPS_SA[6:0] SA0
- PRCM.PRM_VC_SMPS_SA[22:16] SA1

2. Set voltage configuration register addresses.

The addresses of the voltage configuration registers of the power ICs are set in the corresponding bit fields. The voltage controller can support addresses of two different voltage configuration registers (belonging to same or different power ICs).

PRCM.PRM_VC_SMPS_VOL_RA[7:0] VOLRA0		Depend on the characteristics of the connected power ICs.
PRCM.PRM_VC_SMPS_VOL_RA[23:16] VOLRA1		

3. Set command configuration register addresses.

The addresses of the command configuration registers of the power ICs are set in the corresponding bit fields. The voltage controller can support addresses of two different command configuration registers (belonging to same or different power ICs).

PRCM.PRM_VC_SMPS_CMD_RA[7:0] CMDRA0		Depend on the characteristics of the connected power ICs.
PRCM.PRM_VC_SMPS_CMD_RA[23:16] CMDRA1		

4. Set configuration pointers for the VDD channels.

The configuration pointers allow the selection of one of four configurations for each voltage channel (VDD1 and VDD2):

- Two slave I²C interfaces (slave address)
- Two voltage configuration registers
- Two command configuration registers
- Two power-mode voltage levels

PRCM.PRM_VC_CH_CONF[16] SA1		Slave address pointer (SA1 for VDD2, and SA0 for VDD1)
PRCM.PRM_VC_CH_CONF[0] SA0		
PRCM.PRM_VC_CH_CONF[17] RAV1		Voltage configuration register address pointer (RAV1 for VDD2, and RAV0 for VDD1)
PRCM.PRM_VC_CH_CONF[1] RAV0		
PRCM.PRM_VC_CH_CONF[18] RAC1		Command configuration register address pointer (RAC1 for VDD2, and RAC0 for VDD1)
PRCM.PRM_VC_CH_CONF[2] RAC0		
PRCM.PRM_VC_CH_CONF[19] RACEN1		Select voltage or command configuration register for FSM commands (RACEN1 for VDD2, and RACEN0 for VDD1)
PRCM.PRM_VC_CH_CONF[3] RACEN0		
PRCM.PRM_VC_CH_CONF[20] CMD1		Command voltage level selection pointer (CMD1 for VDD2, and CMD0 for VDD1)
PRCM.PRM_VC_CH_CONF[4] CMD0		

5. Configure I²C.

At power-on reset, the I2C4 is in HS mode. In HS mode, a master code value must be configured for the preamble I²C HS transmission. If the external power ICs do not support I²C HS mode, the interface can be switched to fast/standard (F/S) mode. By default, a repeated-start operation for communication is enabled. If necessary, it can be disabled.

For more information, see [Chapter 18](#), I²C.

PRCM.PRM_VC_I2C_CFG[2:0] MCODE		Master code for I ² C HS preamble
PRCM.PRM_VC_I2C_CFG[3] HSEN	0x0	Switch to F/S mode.
PRCM.PRM_VC_I2C_CFG[4] SREN	0x0	Disable repeated start operation.

4.12.6.5 Event Generator Programming Examples

The event generator feature allows the MPU power domain to be switched between on and off (or placed in idled mode). This is intended to implement an efficient activity modulation of the MPU power state with minimum software support.

When the event generator is activated, the PRCM module ensures that the CORE power domain always follows the MPU power domain activity.

The PRCM.PM_EVGENONTIM_MPU and PRCM.PM_EVGENOFFTIM_MPU registers of the event generator counter allow the configuration of the on and off durations (the number of system clock cycles) for the MPU power domain. The PRCM.PM_EVGENCTRL_MPU register allows the enabling/disabling of the event generator feature and control of the way on and off values are loaded in the counter.

There are three ways to load the counter with the next counting value:

- Load on update of the corresponding PRCM.PM_EVGENONTIM_MPU or PRCM.PM_EVGENOFFTIM_MPU register.
- Load the on-time value when the MPU power domain wakes up, and the off-time value when the MPU power domain starts the sleep transition (the MPU executes the WFI instruction).
- Automatically load the on-time value when the off-time value expires, and automatically load the off-time value when the on-time value expires.

When the counter times out at the end of the on/off time, it triggers the interrupt/wake-up transition, respectively. The software can use the on-time interrupt to trigger the WFI processor instruction to idle the processor clock. Similarly, the wake-up event at the end of the off time restarts the processor clock and interrupts the processor. To enable the corresponding interrupts, the MPU interrupts mask must be set in the PRCM.PRM_IRQENABLE_MPU register.

4.13 PRCM Use Cases and Tips

4.13.1 Voltage Control Using VMODE

4.13.1.1 Introduction

The PRCM module allows direct simple control of VDD1 and VDD2 through the dedicated signals `sys_nvmode1` and `sys_nvmode2`. A single voltage value can be linked in the external power IC to a given state of `sys_nvmode1` or `sys_nvmode2`. This allows direct voltage management (see [Table 4-85](#)).

Table 4-85. VDD1 and VDD2 Voltage Control Through VMODE

sys_nvmode Signals	Voltage Values	Comments
sys_nvmode1 is high.	VDD1 value 1	VDD1 value 1 depends on the power IC programming.
sys_nvmode1 is low.	VDD1 value 2	VDD1 value 2 depends on the power IC programming.
sys_nvmode2 is high.	VDD2 value 1	VDD2 value 1 depends on the power IC programming.
sys_nvmode2 is low.	VDD2 value 2	VDD2 value 2 depends on the power IC programming.

NOTE: The polarity of `sys_nvmode1` and `sys_nvmode2` is programmable. This means that the PRCM module sets them high or low, depending on the user settings. For this reason, the external power IC must be configured to provide a given voltage level depending on the states of the `sys_nvmodex` signals.

Assertion of `sys_nvmode1` and `sys_nvmode2` (low or high, depending on the chosen polarity) occurs immediately after a device sleep or wake-up transition. When the PRCM module triggers a sleep transition (ON to OFF, or ON to retention), it deasserts `sys_nvmode1` and `sys_nvmode2`. When the PRCM module detects a device wake-up transition (retention to on, or off to on), it asserts `sys_nvmode1` and `sys_nvmode2`.

NOTE: `sys_nvmode1` and `sys_nvmode2` are managed as one signal from the PRCM standpoint. In other words, their settings and assertion conditions are managed globally, without any granularity. The power IC software sets different values for VDD1 and VDD2, if necessary.

From the PRCM standpoint, using the VMODE signals is mutually exclusive with using the dedicated I2C4 interface to the external power IC; `sys_nvmodex` signals share the same physical interface as I2C4 at device boundary.

Using VMODE voltage control is an easy way to switch VDD1 and VDD2 voltage values upon device power state transitions. The following section gives the programming steps to achieve voltage management through VMODE signals.

4.13.1.2 Programming Sequence

4.13.1.2.1 Initialization Procedure

1. Configure `sys_nvmode1` and `sys_nvmode2` at the device level.

CONTROL.CONTROL_PADCONF_I2C4_SCL[15:0]	Mux mode1
CONTROL.CONTROL_PADCONF_I2C4_SCL[31:16]	Mux mode1

The correct multiplexing mode is selected at the device level to select `sys_nvmode1` and `sys_nvmode2` on the balls. This is done in the SCM registers, as indicated. For further details, see [Chapter 7, System Control Module](#).

2. Activate VMODE control.

PRM_VOLTCTRL[4] SEL_VMODE	0x1
---	-----

VMODE control is selected in the PRCM module. This also ensures the other interfaces to the power IC are correctly deactivated and managed.

- Set the polarity of sys_nvmode1 and sys_nvmode2.

PRM_POLCTRL[0] EXTVOL_POL	0x1 => sys_nvmodex signals are active high
---	--

Depending on the polarity set, the VMODE signals remain high or low until a transition is initiated. Their states then automatically toggle to the opposite state and return when the reverse transition is initiated.

- Set the voltage stabilization delays.

PRM_VOLTSETUP1[31:16] SETUP_TIME2	VDD2 voltage stabilization time
PRM_VOLTSETUP1[15:0] SETUP_TIME1	VDD1 voltage stabilization time

SETUP_TIME1 and SETUP_TIME2 are power IC-dependent parameters for voltage stabilization time for VDD1 and VDD2, respectively. For further details, see the power IC documentation.

- Configure the power IC.

This step relies entirely on power IC software settings. The purpose here is to link a voltage value to both VDD1 and VDD2 depending on the state of the sys_nvmodex signals. For further details, see the power IC documentation.

4.13.1.2.2 VMODE Signals Toggling

- Has a sleep/wake-up transition been initiated?

As stated previously, when VMODE voltage control is selected, the PRCM module automatically toggles sys_nvmodex signals and device sleep and wake-up transitions. This means the user has nothing more to control except the device transitions, as explained in this document. When a transition is initiated, sys_nvmode1 and sys_nvmode2 toggle according to their programmed polarity and alert the power IC to switch VDD1 and VDD2 to the programmed values.

- Wait for stabilization time.

Depending on the SETUP_TIME1 and SETUP_TIME2 settings, the PRCM module starts a countdown immediately after the VMODE signal state changes. This ensures that the voltages provided by the power IC are stable before switching the device to the desired power state.

4.13.1.2.3 Summary Flow Chart

Figure 4-88 is a flow chart of VMODE voltage control.

Figure 4-88. Voltage Control Through VMODE Flow Chart

4.14 PRCM Register Manual

This section gives information about all modules and features in the high-tier device. See [Section 1.5, OMAP35xx Family](#), to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

[Table 4-86](#) lists the Instance Summary of the CM modules. [Table 4-87](#) through [Table 4-285](#) provide register mapping summaries of the CM registers and describe the bits in the individual registers.

[Table 4-287](#) lists the Instance Summary of the PRM modules. [Table 4-288](#) through [Table 4-498](#) provide register mapping summaries of the PRM registers and describe the bits in the individual registers.

Table 4-112. CM_CLKEN_PLL_MPU

Address Offset	0x0000 0004	Instance	MPU_CM
Physical Address	0x4800 4904		
Description	This register controls the DPLL1 modes.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_MPU_DPLL_LPMODE		RESERVED		MPU_DPLL_FREQSEL				EN_MPU_DPLL_DRIFTGUARD		EN_MPU_DPLL					

Bits	Field Name	Description	Type	Reset
31:11	RESERVED	Write 0s for future compatibility. Read returns 0.	R	0x000000
10	EN_MPU_DPLL_LPMODE	This bit allows to enable or disable the LP mode of the MPU DPLL. Writing this bit to switch the mode between LP or normal mode will take effect only when the DPLL will have transition into the bypass or stop state, followed by a lock or re-lock of the DPLL. 0x0: Disables the DPLL LP mode to re-enter the normal mode at the following lock or re-lock sequence. 0x1: Enables the DPLL LP mode to enter the LP mode at the following lock or re-lock sequence.	RW	0x0
9:8	RESERVED	Write 0s for future compatibility. Read returns 0.	RW	0x0
7:4	MPU_DPLL_FREQSEL	This bit field allows selecting the proper range of the DPLL1 internal frequency depending on the DPLL reference clock and the N divider. 0x3: 0.75 MHz—1.0 MHz 0x4: 1.0 MHz—1.25 MHz 0x5: 1.25 MHz—1.5 MHz 0x6: 1.5 MHz—1.75 MHz 0x7: 1.75 MHz—2.1 MHz 0xB: 7.5 MHz—10 MHz 0xC: 10 MHz—12.5 MHz 0xD: 12.5 MHz—15 MHz 0xE: 15 MHz—17.5 MHz 0xF: 17.5 MHz—21 MHz	RW	0x1
3	EN_MPU_DPLL_DRIFTGUARD	This bit allows to enable or disable the automatic recalibration feature of the MPU DPLL. The DPLL1 will automatically start a recalibration process upon assertion of the recal flag if this bit is set. 0x0: Disables the DPLL1 automatic recalibration mode 0x1: Enables the DPLL1 automatic recalibration mode	RW	0x0
2:0	EN_MPU_DPLL	DPLL1 control; Other enums: Reserved 0x5: Put the DPLL1 in low power bypass mode 0x7: Enables the DPLL1 in lock mode	RW	0x5

4.14.2 PRM Module Registers

This section describes the PRM module registers. [Table 4-287](#) lists the physical address of the the PRM modules. [Table 4-288](#) through [Table 4-498](#) provide register mapping summaries and describe the bits in the individual registers.

4.14.2.1 PRM Module Summary

Table 4-287. PRM Instance Summary

Module Name	Base address (hex)	Size
IVA2_PRM	0x4830 6000	8192 bytes
OCP_System_Reg_PRM	0x4830 6800	8192 bytes
MPU_PRM	0x4830 6900	8192 bytes
CORE_PRM	0x4830 6A00	8192 bytes
SGX_PRM	0x4830 6B00	8192 bytes

Table 4-287. PRM Instance Summary (continued)

Module Name	Base address (hex)	Size
WKUP_PRM	0x4830 6C00	8192 bytes
Clock_Control_Reg_PRM	0x4830 6D00	8192 bytes
DSS_PRM	0x4830 6E00	8192 bytes
CAM_PRM	0x4830 6F00	8192 bytes
PER_PRM	0x4830 7000	8192 bytes
EMU_PRM	0x4830 7100	8192 bytes
Global_Reg_PRM	0x4830 7200	65536 bytes
NEON_PRM	0x4830 7300	8192 bytes
USBHOST_PRM	0x4830 7400	8192 bytes

NOTE: Before initiating a domain sleep transition (ON to OFF) on the MPU and CORE power domains, the CORE memory banks must be configured to automatically switch to ON power state when the CORE power domain wakes up (OFF to ON). This is required for correct booting.

This is done by setting the [PM_PWSTCTRL_CORE \[19:18\] MEM2ONSTATE](#) bit field to 0x3 and the [PM_PWSTCTRL_CORE \[17:16\] MEM1ONSTATE](#) bit field to 0x3.

Interconnect

This chapter describes the interconnect.

NOTE: This chapter provides information about all modules and features in the high-tier device. See [Section 1.5, AM35xx Family](#), to check availability of modules and features.

NOTE:

- The L3 interconnect is an instantiation of the **SonicsMX®** interconnect from Sonics, Inc.
- The L4 interconnects are instantiations of the **Sonics3220™** interconnect from Sonics, Inc.

This document contains materials that are ©2003-2007 Sonics, Inc., and that constitute proprietary information of Sonics, Inc.

SMX is an abbreviation for SonicsMX.

Topic	Page
5.1 Interconnect Overview	614
5.2 L3 Interconnect	622
5.3 L4 Interconnects	677

5.1 Interconnect Overview

5.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- Initiator: Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).
- Target: Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

NOTE: A module can have several separate ports; therefore, a module can be both an initiator and a target.

- Agent: Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- OCP: Open-core protocol (www.ocpip.org) is point-to-point standard protocol between one master port and one slave port.
- OCP master port: Port that can generate OCP commands. An initiator includes at least one master port.
- OCP slave port: Port that responds to OCP commands. A target includes one slave port.
- Interconnect: The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it.
- Register target (RT): Special TA used to access the interconnect internal configuration registers
- Dataflow signal: Any OCP signal that is part of a clearly identified OCP transfer or dataflow (typically: command, address, byte enables, etc.). The signal behavior is defined by the OCP protocol semantics.
- Sideband signal: Any OCP signal whose behavior is not associated to a precise OCP transaction or dataflow. The OCP standard does not define specific semantics for these signals.
- Out-of-band error: Any OCP signal whose behavior is associated to an error-reporting scheme of the device, as opposed to in-band errors.

NOTE: Interrupt requests and DMA requests are not routed by the interconnect in the device.

- Firewall: A programmable feature integrated in a target agent or L4 interconnect to prevent unauthorised access to or from a module. A firewall can be configured using three criteria:
 - Initiator requesting access
 - Address space access
 - Type of access
- Thread: Logical entities that allow to have separate independent data flows on a single port.
- Multithreaded ports: A physical port able to simultaneously handle several outstanding transactions. On a multithreaded port, one physical channel (port) is used concurrently for several logical channels (threads). The transfer in each thread must remain in order with respect to each other, but the order between threads can change between requests and responses. Thread management is used for performance optimization purposes and is automatically handled by the system.
- ConnID: Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted inband with the request and is used for firewall and error-logging mechanism.
- Firewall comparison mechanism: A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- MCcmd qualifier: Command bus that indicates the type of transfer requested. [Table 5-1](#) lists the commands encoded.

Table 5-1. MCmd Qualifier Description

MCmd[2:0]	Transaction Type
0 0 0	Idle
0 0 1	Write
0 1 0	Read
0 1 1	ReadEx
1 0 0	Not used
1 0 1	Write nonposted
1 1 0	Not used
1 1 1	Not used

- MReqInfo qualifier: Four MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in [Table 5-2](#).

Table 5-2. MReqInfo Qualifier Description

Qualifiers	Description
MReqType	0: Data access 1: Opcode fetch
MReqSupervisor	0: User mode 1: Supervisor mode
MReqDebug	0: Functional access 1: Debug access

- [L3_PM_REQ_INFO_PERMISSION_i](#): Register that configures the combination of the MReqInfo, allowing access permission to the TM based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction.

Table 5-3. SResp Qualifier Description

SResp[1:0]	Description
0 0	No response
0 1	Data valid/accept
1 0	Not used
1 1	Error

5.1.2 Architecture Overview

The device memory hierarchy includes four levels:

- L1 is internal to the CPUs. It concerns data exchange with the internal Level1 cache memory subsystem, and it is the closest memory to the microprocessor unit (MPU) core and the IVA2.2 core.
- L2 is included in the IVA2.2 subsystem and the MPU subsystem.
- The chip-level interconnect consists of one L3 interconnect and four L4 interconnects. It enables communication among the modules and subsystems in the device.

[Figure 5-1](#) shows an overview of the L3 and L4 interconnect architecture.

- L3 handles many types of data transfers, especially exchanges with system-on-chip/external memories. L3 transfers data with a maximum width of 64 bits from the initiator to the target. The L3 interconnect is a little-endian platform
- L4 is composed of the L4-Core, L4-Per, L4-Wakeup, and L4-Emu interconnects and handles data transfers to peripherals. It supports 32-bit data width transfer and is optimized to support the interconnection of many peripheral targets. These backplanes assume little-endian transactions for narrower targets (8-bit, 16-bit) when doing data packing and unpacking.

Figure 5-1. Interconnect Architecture Overview

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access depending on the characteristics of the module.

To unauthorised a module or L4 interconnect access, some TAs include configurable firewalls (FWs). A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default setting is fully functional; it enables all possible functional data paths and a minimal default protection setting. However, it is possible to modify the interconnect parameters to fit user expectations.

5.1.3 Module Distribution

IAs and TAs provide the interface to connect the different modules and the interconnect.

[Table 5-4](#) through [Table 5-13](#) list the device modules, subsystems, and associated agents. The agents are listed for each interconnect domain:

- L3 initiator and target agents
- L4-Core initiator and target agents
- L4-Per initiator and target agents
- L4-Emu initiator and target agents
- L4-Wakeup initiator and target agents

5.1.3.1 L3 Interconnect Agents

[Table 5-4](#) and [Table 5-5](#) list the IAs and TAs, respectively, of the L3 interconnect.

Table 5-4. L3 Initiator Agents

Module Name	Description
MPU SS	MPU subsystem port
Display SS	Display subsystem port
IVA2.2 SS	IVA2.2 subsystem port
SGX SS	Graphics subsystem port
CAMERA SS	Camera subsystem port
SAD2D	Die-to-die port
sDMA read	System DMA read port
sDMA write	System DMA write port
High-Speed (HS) USB OTG	Universal Serial Bus High-Speed port OTG controller
High-Speed (HS) USB Host	Universal serial bus High-Speed port host controller
DAP	Debug access port (JTAG/Emulation access to system resources)

Table 5-5. L3 Target Agents

Module Name	Description
SMS	SDRAM memory scheduler port
GPMC	General-purpose memory controller (for flash memory, SRAM, SROM, etc.) port
OCM-ROM	On-chip memory ROM port
OCM-RAM	On-chip memory RAM port
SGX	Graphics subsystem port
IVA2.2	Image video and audio accelerator subsystem port
RT	Register target port to configure L3
L4-Core	Port for L4-Core interconnect
L4-Peripherals	Port for L4-Per interconnect

Table 5-5. L3 Target Agents (continued)

Module Name	Description
L4-Emu	Port for L4-Emu interconnect

For more details on the register target module, see [Section 5.2.3.2, Register Target](#).

5.1.3.2 L4-Core Agents

Table 5-6. L4-Core Initiator Agent

Module Name	Description
L3 interconnect	L3 interconnect port

NOTE: A unique L3 port is used for communication with the L4-Core. For the list of initiators allowed to access the L4 Core peripherals, see [Table 5-14](#).

Table 5-7. L4-Core Target Agents

Module Name	Description
Display subsystem	Display subsystem configuration port
Camera subsystem	Camera subsystem port
High-Speed (HS) USB OTG	Universal serial bus High-speed port OTG
High-Speed (FS) USB Host	Universal serial bus High-Speed port Host controller
UART1	Universal asynchronous receiver transmitter port 1
UART2	Universal asynchronous receiver transmitter port 2
I2C1	Multimaster interintegrated circuit 1
I2C2	Multimaster interintegrated circuit 2
I2C3	Multimaster interintegrated circuit 3
McBSP1	Multichannel buffered serial port 1

32KTIMER	32-kHz timer

5.1.4 Connectivity Matrix

[Table 5-14](#) lists the functional paths between the L3 interconnect initiator modules and the L3 and L4 TAs. The functional paths are indicated by the use of the following:

- Cell contains a + sign when a functional path exists.
- Cell is blank when no functional path exists.

Table 5-14. Connectivity Matrix

Initiator Ports	L4-Core Target ⁽¹⁾	L4-Per Target ⁽¹⁾	L4-Emu Target ⁽¹⁾	L4-Wakeup Target ⁽¹⁾	SMS Target	GPMC Target	OCM RAM Target	OCM ROM Target	RT Target	IVA2.2 Target	SGX Target	MAD2D
MPU IA	+	+	+	+	+	+	+	+	+	+	+	+
SGX IA					+	+	+					+
IVA2.2 IA	+	+	+	+	+	+	+		+	+		+
DSS IA					+		+					+
CAM IA					+		+					+
HS USB Host IA					+	+	+					+
HS USB OTG IA					+	+	+					+
sDMA RD IA	+	+	+	+	+	+	+			+	+	+
sDMA WR IA	+	+	+	+	+	+	+			+	+	+
DAP IA	+	+	+	+	+	+	+	+	+	+	+	+
SAD2D IA	+	+	+	+	+	+	+					

⁽¹⁾ A functional data path always exists from L4 IAs (Core, Per, Emu, and Wakeup) to any L4 target module (Core, Per, Emu, and Wakeup). As a consequence, all L3 initiator modules for which a data path exists to an L4 TA can access L4 peripherals. Restrictions on peripheral access depend on L4 protection mechanism. For more details, see [Section 5.3.3.3](#).

5.2 L3 Interconnect

This section describes the L3 interconnect and its components. With the exception of register points, each component includes functionality for both the request and response network.

5.2.1 Overview

The L3 interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

Figure 5-2 shows the L3 interconnect.

100-007

The following are the main features of the L3 interconnect:

- 64-bit multipath interconnect to eliminate on-chip bottlenecks
- Special internal target for access to L3 registers (RT)
- Guaranteed quality of service for real-time hardware operators, while maintaining optimal memory latency for MPU accesses to memory resources
- True little-endian platform
- Transaction error tracking and logging
- Built-in protection features:
 - Allow access only to authorized initiator
 - Distributed region-based firewalls for system resource sharing and protection management
- Signaling support for chip-level power management infrastructure
- Two interrupt line signaling transaction error

5.2.2 L3 Interconnect Integration

5.2.2.1 Clocking, Reset, and Power-Management Scheme

5.2.2.1.1 Clocks

The power, reset, and clock management (PRCM) module provides the L3_ICLK as the main clock to the L3 interconnect.

In addition to L3_ICLK, two additional sample signals are provided to module agents to allow internal synchronization. The modules are as follows:

- L4-Core
- L4-Per

For more details on the L3 clock and its setting, see [Chapter 4, Power, Reset, and Clock Management](#).

Table 5-15. L3 Interconnect Clocks

Type	Name	Source	Description
Interface/functional	L3_ICLK	PRCM	Main clock for L3 interconnect

5.2.2.1.2 Resets

The L3 interconnect receives a single reset signal, CORE_RST, from the PRCM module. CORE_RST is the reset signal to the core power domain. (For more details, see [Chapter 4, Power, Reset, and Clock Management](#).) When asserted, CORE_RST resets the L3 internal registers. There is no software reset for the L3 interconnect.

Table 5-16. L3 Interconnect Reset

Type	Reset Domain	Source	Description
Hardware	CORE_RST	PRCM	Asynchronous reset for the entire interconnect

5.2.2.1.3 Power Domain

The L3 interconnect connects into the CORE power domain, which can dynamically switch between supported OPPs. For more details on power voltage scaling, see [Chapter 4, Power, Reset, and Clock Management](#).

Table 5-17. L3 Interconnect Power Domain

Interconnect	Power Domain
L3 interconnect	CORE

5.2.2.1.4 Power Management

As part of the system-wide power-management scheme, the L3 interconnect enters an idle state at the request of the PRCM module. (For more details, see [Chapter 4, Power, Reset, and Clock Management](#).) The L3 interconnect is always in smart-idle mode; that is, it goes into idle state after receiving the request from the PRCM module once all transfer requests are serviced. This functionality is handled by hardware. The L3 interconnect sends an acknowledge signal back to the PRCM module when it enters the idle state.

5.2.2.2 Hardware Requests

5.2.2.2.1 Interrupt Requests

Three interrupt lines are present at the boundary of the L3 interconnect (see [Table 5-18](#)). They are used for hardware error management.

Table 5-18. L3 Interconnect Hardware Requests

Type	Name	Destination	Description
Interrupt	M_IRQ_9	MPU interrupt controller for debug errors	L3 interconnect provides a mechanism to group core-detected and internal interconnect errors. See Section 5.3.3.4, Error Handling .
Interrupt	M_IRQ_10	MPU interrupt controller for application errors	
Interrupt	IVA2_IRQ[39]	IVA2.2 interrupt controller for application errors	

5.2.3 L3 Interconnect Functional Description

5.2.3.1 Initiator Identification

An InitiatorID is assigned to every thread on every initiator socket. The ID uniquely identifies the initiator and thread for an interconnect transfer see [Table 5-19](#). The interconnect uses InitiatorIDs for a number of purposes, including the following:

- Initiator source identification for the protection mechanism (see [Section 5.2.3.3, L3 Protection and Firewalls](#))
- Response route generation (performed internally to the TAs)
- Firewall error logging
- L3 interconnect error logging

Table 5-19. InitiatorID Definition

Initiator	InitiatorID
HS USB Host	0
HS USB OTG	2
sDMA rd	3, 4, 5, 6
sDMA wr	7, 8
DAP	9
CAM	10, 11, 12
SGX	13
IVA2.2 SS DMA	14, 15, 16, 17, 18, 19
IVA2.2 SS	20, 21, 22
MPU SS	23, 24, 25, 26, 27
SAD2D	28
LCD	29

5.2.3.2 Register Target

An RT is a specialized TA used to access L3 interconnect internal configuration registers.

RT configuration options are a subset of those available for TAs. For more details, see [Section 5.2.5.3](#).

5.2.3.3 L3 Protection and Firewalls

Protection in the device relies heavily on L3 firewalls and their configuration. Nine targets are protected through the use of firewalls. The number of protected regions varies on the target, with a maximum of eight regions. [Table 5-20](#) lists the protection type and the number of protected regions for each target.

Table 5-20. Target Firewall and Region Configuration

Target	Firewall	Number of Regions
SMS	Included in the SMS module	See Chapter 11 , <i>Memory Subsystem</i> .
GPMC	Yes	8
OCM-RAM	Yes	8
OCM-ROM	Yes	2
MAD2D	Yes	8
IVA2.2 target	Yes	4
L4-Core	Included in the L4 module	See Section 5.3 , <i>L4 Interconnects</i> .
L4-Wakeup	Included in the L4 module	See Section 5.3 , <i>L4 Interconnects</i> .
L4-Emu	Included in the L4 module	See Section 5.3 , <i>L4 Interconnects</i> .
RT	Yes	2

The protection mechanism designates protection regions within the address space of certain targets. Access to these regions is granted only for certain initiators, based on transaction attributes (transmitted through MReqInfo). Each protection region is characterized with several configurable attributes (base address, size, specific access rights, and priority setting).

The protection mechanism uses the following attributes of a request:

- The address field and the address space field are used to determine which region has been hit. The region ID selects one table entry of the firewall look-up table.
- The region ID points to a unique set of permission registers: Read_Permission, Write_Permission, ReqInfo_Permission.
- The Initiator ID is used to determine the permission of the initiator (read/write permission) with respect to the concerned region.
- The access types (read or write) and the transaction attributes (MReqInfo in-band qualifiers) are used to grant or reject the access.

The first check determines whether the type of incoming request (read or write) is allowed, according to the Initiator MConnID and its read and write permissions. The second check determines whether the MReqInfo bits of the incoming request are within the allowed pattern established by the MReqInfo permission bits. If both check results are positive, the request is allowed to access the target. Otherwise, the access is denied, the request is not forwarded to the target, an out-of-band error indication is reported, and an in-band error response is returned to the initiator (except for writes that were posted at the IA).

[Figure 5-3](#) shows the flow used to identify and accept a new request.

Figure 5-3. Flow Chart of the Protection Mechanism

100-014

To summarize, firewalls accept or reject a request depending on the following:

- Initiator originating the request
- Command (read or write) requested
- MReqInfo bus state
- Region access in the target memory space

Software must configure the L3 firewalls properly to allow the right initiators, with the right MReqInfo access, on the well-defined size region. All the registers relative to the L3 firewalls are grouped in the protection mechanism (PM) register block.

NOTE: The PM qualifies the protection mechanism register associated with a firewall target. The targets protected by a firewall are listed in [Table 5-20](#). These PM registers do not exist if no firewall is associated with the target.

5.2.3.3.1 Protection Region

Two types of regions are distinguished in a target firewall (see [Figure 5-4](#)):

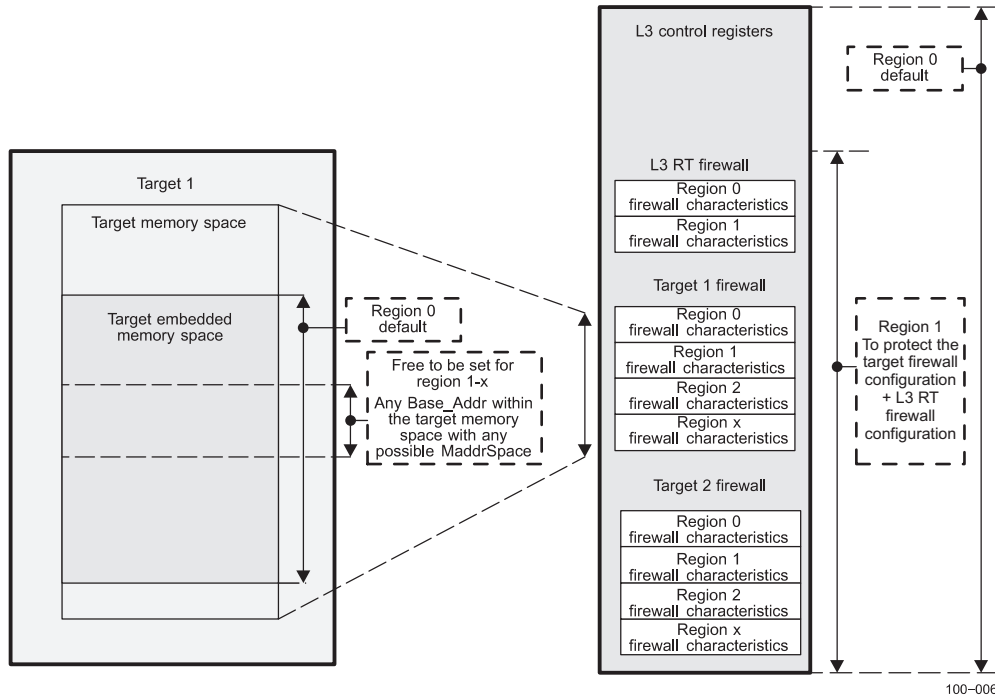

- Default region: Available in all targets; spans the entire target address range
- Normal region: Number varies in a target; they have identical capabilities

Each region has the following characteristics:

- A base address, relative to the target address itself, and an address space

- A size
- Specific access rights, as defined through the MReqInfo qualifiers
- A priority level, from 0 (lowest) to 3 (highest)

Figure 5-4. L3 Firewall Implementation

5.2.3.3.1.1 Default Region/Region0

Region 0 is the default region of a whole target; it spans the entire target address space.

The default region is always the lowest priority. This region is systematically overlapped when other regions are set.

The `L3_PM_ADDR_MATCH_k` register is not accessible. Its configuration corresponds to all the possible addresses for the target, including all of `ADDR_SPACE`. It is not possible to program multiple `ADDR_SPACE` addresses in a normal region.

5.2.3.3.1.2 Normal Regions

Normal regions have identical features.

A given request either maps into a specific protection region or is considered to have hit the default protection region if no normal region is hit.

The protection regions can only be configured for a memory space that is power-of-two in size and size-aligned using the `SIZE` bit field `L3_PM_ADDR_MATCH_k [7:3]` (as listed in Table 5-21). When the `SIZE` bit field `L3_PM_ADDR_MATCH_k [7:3]` is set to 0, the region is disabled.

NOTE: k denotes the region number. Depending on the target, n varies from 0 to 7.

Table 5-21 lists the size encoding for each value set in the `SIZE` bit field.

Table 5-21. L3 Firewall Size Parameter Definition

Possible Configuration		
Size ⁽¹⁾	Region Size	Base_Addr ⁽²⁾
0x0	Region disabled	Any (nonsignificant)
0x1	1K-byte	0x0000000
		0x0000400
		0x0000800
0x2	2K-byte	0x0000000
		0x0000800
		0x0001000
...
0x17	2 ^{^(17-1)} K-byte	
Others	Not allowed	-

⁽¹⁾ When the size parameter is set to 0, the region is disabled.

⁽²⁾ The base address depends on user settings.

5.2.3.3.2 Priority Level Overview

Each L3 firewall region is prioritized. Depending on its priority level, a region can override the settings of another region.

- Region 0 is the only allowed priority 0 region (lowest priority).
- Region 1 is the only allowed priority 3 region (highest priority).
- Others regions are defined as priority 1 or 2.

CAUTION

LEVEL bitfield value of ADDR_MATCH_1 register (Region 1 firewall configuration) must be kept to his default reset value and must not be changed; otherwise, the result will be unpredictable and can create unexpected protection holes or denial of service.

Protection level is defined by the LEVEL bit [L3_PM_ADDR_MATCH_k](#) , where n is greater than 2. [Figure 5-5](#) represents the priority level with associated regions.

When an address hits two or more regions with different priority levels, the highest priority region protections are applied. The overlay region can overlap all or a part of a nonoverlay region.

CAUTION

Configuring two overlapping protection regions with the same priority level leads to undefined behavior.

Hardware behavior in the case of overlapping protection regions is undefined. A region with higher priority must be used to mask a region that is being reprogrammed, and any protection holes must be avoided during this reconfiguration.

To change the protection settings of a region, follow this procedure:

1. Ensure that a free region is available to be used as a high-priority region.

2. Program this region as a high-priority region so its parameters match the region to be changed. The final programming must be the [L3_PM_ADDR_MATCH_k](#) register, which includes the priority attribute and the size parameter to enable the region.
3. Disable the region to be configured or reconfigure it by setting the SIZE bit field to 0.
4. Set up all region control registers with the new configuration. The final programming must be the [L3_PM_ADDR_MATCH_k](#) register, which includes the size parameter to enable the region.
5. Disable the high-priority region by setting its size to 0.

This procedure must be used each time there is an overlap between the originally defined region and the newly defined region. The use of a high-priority region is required to keep protection active during programming.

Figure 5-5. L3 Region Overlay and Priority Level Overview

100-008

5.2.3.3.3 Read and Write Permission

Read permission and write permission are configured using two registers:

- [L3_PM_READ_PERMISSION_i](#)
- [L3_PM_WRITE_PERMISSION_i](#)

The [L3_PM_READ_PERMISSION_i](#) and [L3_PM_WRITE_PERMISSION_i](#) registers allow the setting of read and write permission to one or more initiators. To grant read or write access, set the bit associated with the initiator to 1.

5.2.3.3.4 REQ_INFO_PERMISSION Configuration

The firewall comparison mechanism enables access to a protected target only when a correct combination of four MReqInfo in-band parameters is transmitted.

MReqInfo is a combination of a fixed 3-bit pattern that corresponds to a combination of the parameters MReqDebug, MReqType, and MReqSupervisor.

Different valid MReqInfo combinations can be defined for each L3 firewall region based on the [L3_PM_REQ_INFO_PERMISSION_i](#) value, which is programmed by software.

For each region, [L3_PM_REQ_INFO_PERMISSION_i](#) lists the possible MReqInfo combinations. Setting a Reqbit in this register determines the type of access authorised to the initiator.

[Table 5-22](#) lists the MReqInfo combinations available and the Reqbit associated with it.

Table 5-22. MReqInfo Parameter Combinations

Reqbit	MReqInfo		
	MReqSupervisor	MReqDebug	MReqType
0	User	Functional	Data
1	User	Functional	Code
2	User	Debug	Data
3	User	Debug	Code
4		Reserved for non-GP devices	
5		Reserved for non-GP devices	
6		Reserved for non-GP devices	
7		Reserved for non-GP devices	
8	Supervisor	Functional	Data
9	Supervisor	Functional	Code
10	Supervisor	Debug	Data
11	Supervisor	Debug	Code
12		Reserved for non-GP devices	
13		Reserved for non-GP devices	
14		Reserved for non-GP devices	
15		Reserved for non-GP devices	

[Figure 5-6](#) shows an example of the [L3_PM_REQ_INFO_PERMISSION_i](#) setting. In this example, [L3_PM_REQ_INFO_PERMISSION_i](#) is set to 0x0C05 (16'b0000_1100_0001_0101) for a specific region, which will grant access only if the request:

- User + Functional + Data
- User + Debug + Data
- Supervisor + Debug + Data
- Supervisor + Debug + Code

Figure 5-6. Example of REQ_INFO_PERMISSION Register

As another example, to configure a target accessible only for data and in a user mode, Reqbit 0, 1, 2 and 3 must be set. Therefore, the `L3_PM_REQ_INFO_PERMISSION_i` register must be set to 0x000F.

5.2.3.3.5 L3 Firewall Registers Overview

Table 5-23 lists the L3 firewall permission-setting registers. `L3_PM_ADDR_MATCH_k`, which is shown in this table, is not an accessible register.

Table 5-23. L3 Firewall Permission-Setting Registers

Register Name	Register Field Name	Field Modifiability	Parameter Comments	Region Comments
Region 0				This region is the default region. The default setting can be changed only with correct access according to L3 RT register.
L3_PM_ADDR_MATCH_k (k=0)	ADDR_SPACE[2:0]	Hard coded	Corresponds to all the target memory space	
	SIZE[7:3]	Hard coded	Corresponds to all the target memory space	
	Reserved		Default region: Level 0	
	BASE_ADDR[63:10]	Hard coded	Target-dependent	
L3_PM_REQ_INFO_PERMISSION_i (i=0)	REQ_INFO[15:0]	Yes	Type of access permitted. See Table 5-22.	
L3_PM_READ_PERMISSION_i (i=0)	READ_PERMISSION[15:0]	Yes	Initiator read permission, depending on connections. See Table 5-14.	
L3_PM_WRITE_PERMISSION_i (i=0)	WRITE_PERMISSION[15:0]	Yes	Initiator write permission, depending on connections. See Table 5-14.	

Table 5-23. L3 Firewall Permission-Setting Registers (continued)

Register Name	Register Field Name	Field Modifiability	Parameter Comments	Region Comments
Region 1-7				The default settings can be changed only with correct access based on the L3 RT register.
L3_PM_ADDR_MATCH_k	ADDR_SPACE[2:0]	Yes		
	SIZE [7:3]	Yes	The regions are power-of-two in size and size-aligned with Base_Addr reference. When Size = 0x0, the firewall is deactivated.	
	LEVEL[9]	Yes	Protection region level 0x0: Level 1 0x1: Level 2 Region 1 is always Level 3.	
	BASE_ADDR[63:10]	Yes	Target-dependent	
L3_PM_REQ_INFO_PERMISSION_i	REQ_INFO[15:0]	Yes	Type of access permitted. See Table 5-22 .	
L3_PM_READ_PERMISSION_i	READ_PERMISSION[15:0]	Yes	Initiators read permission, depending on connections. See Table 5-14 .	
L3_PM_WRITE_PERMISSION_i	WRITE_PERMISSION[15:0]	Yes	Initiators write permission, depending on connections. See Table 5-14 .	

5.2.3.3.6 L3 Firewall Error-Logging Registers

[Table 5-24](#) lists the L3 firewall error-logging registers.

Table 5-24. L3 Firewall Error Logging Registers

Register Name	Register Field Name	Field Modifiability	Parameter Comments
L3_PM_ERROR_LOG	CMD[2:0]	Read only	Log the OCP command of the request that caused a protection violation. See Table 5-1 .
	REGION[6:4]	Read only	Log the region number targeted by the request that caused the protection violation.
	INITIATOR_ID[15:8]	Read only	Log the InitiatorID request that caused the protection violation. See Table 5-19
	REQ_INFO[20:16]	Read only	Log the MReqInfo bits of the request that caused the protection violation. See Table 5-22 .
	CODE[27:24]	Read/write	Log the error that occurred. See Table 5-26 .
	MULT[31]	Read/write	If a second error is detected before the first is cleared, the MULT bit is set. Once set by hardware, the CODE and MULT bits can be cleared only by software or a full hardware reset. Software clears the CODE and MULT bits by writing a non-zero value to the CODE field and writing 1 to the MULT bit.

5.2.3.3.7 L3 Firewall and System Control Module

When a protection violation occurs, an interrupt is sent to the MPU and IVA2.2 interrupt controller (if enabled). An in-band error is sent back, and an out-band error is logged in the CONTROL.CONTROL_PROT_ERR_STATUS register. Two logging registers are used, depending on the functional mode:

- In application mode:
 - CONTROL.CONTROL_PROT_ERR_STATUS [00]: OCM-ROM protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS [01]: OCM-RAM protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS [02]: GPMC protection violation

- CONTROL.CONTROL_PROT_ERR_STATUS [04]: SMS protection violation
- CONTROL.CONTROL_PROT_ERR_STATUS [05]: MAD2D protection violation
- CONTROL.CONTROL_PROT_ERR_STATUS [06]: IVA2.2 protection violation
- CONTROL.CONTROL_PROT_ERR_STATUS [07]: L4-Core protection violation
- CONTROL.CONTROL_PROT_ERR_STATUS [12]: L3 RT protection violation
- CONTROL.CONTROL_PROT_ERR_STATUS [15]: SAD2D protection violation
- CONTROL.CONTROL_PROT_ERR_STATUS [16]: L4-Per protection violation
- CONTROL.CONTROL_PROT_ERR_STATUS [17]: L4-Emu protection violation
- In debug mode:
 - CONTROL.CONTROL_PROT_ERR_STATUS_DEBUG [00]: OCM-ROM protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS_DEBUG [01]: OCM-RAM protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS_DEBUG [02]: GPMC protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS_DEBUG [03]: SMS protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS_DEBUG [05]: MAD2D protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS_DEBUG [06]: IVA2.2 protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS_DEBUG [12]: L3 RT protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS_DEBUG [16]: L4-Per protection violation
 - CONTROL.CONTROL_PROT_ERR_STATUS_DEBUG [17]: L4-Emu protection violation

When a violation occurs, these bits are cleared when the L3 or L4 firewall embedded error log registers are cleared.

5.2.3.4 Error Handling

5.2.3.4.1 Error Detection and Logging

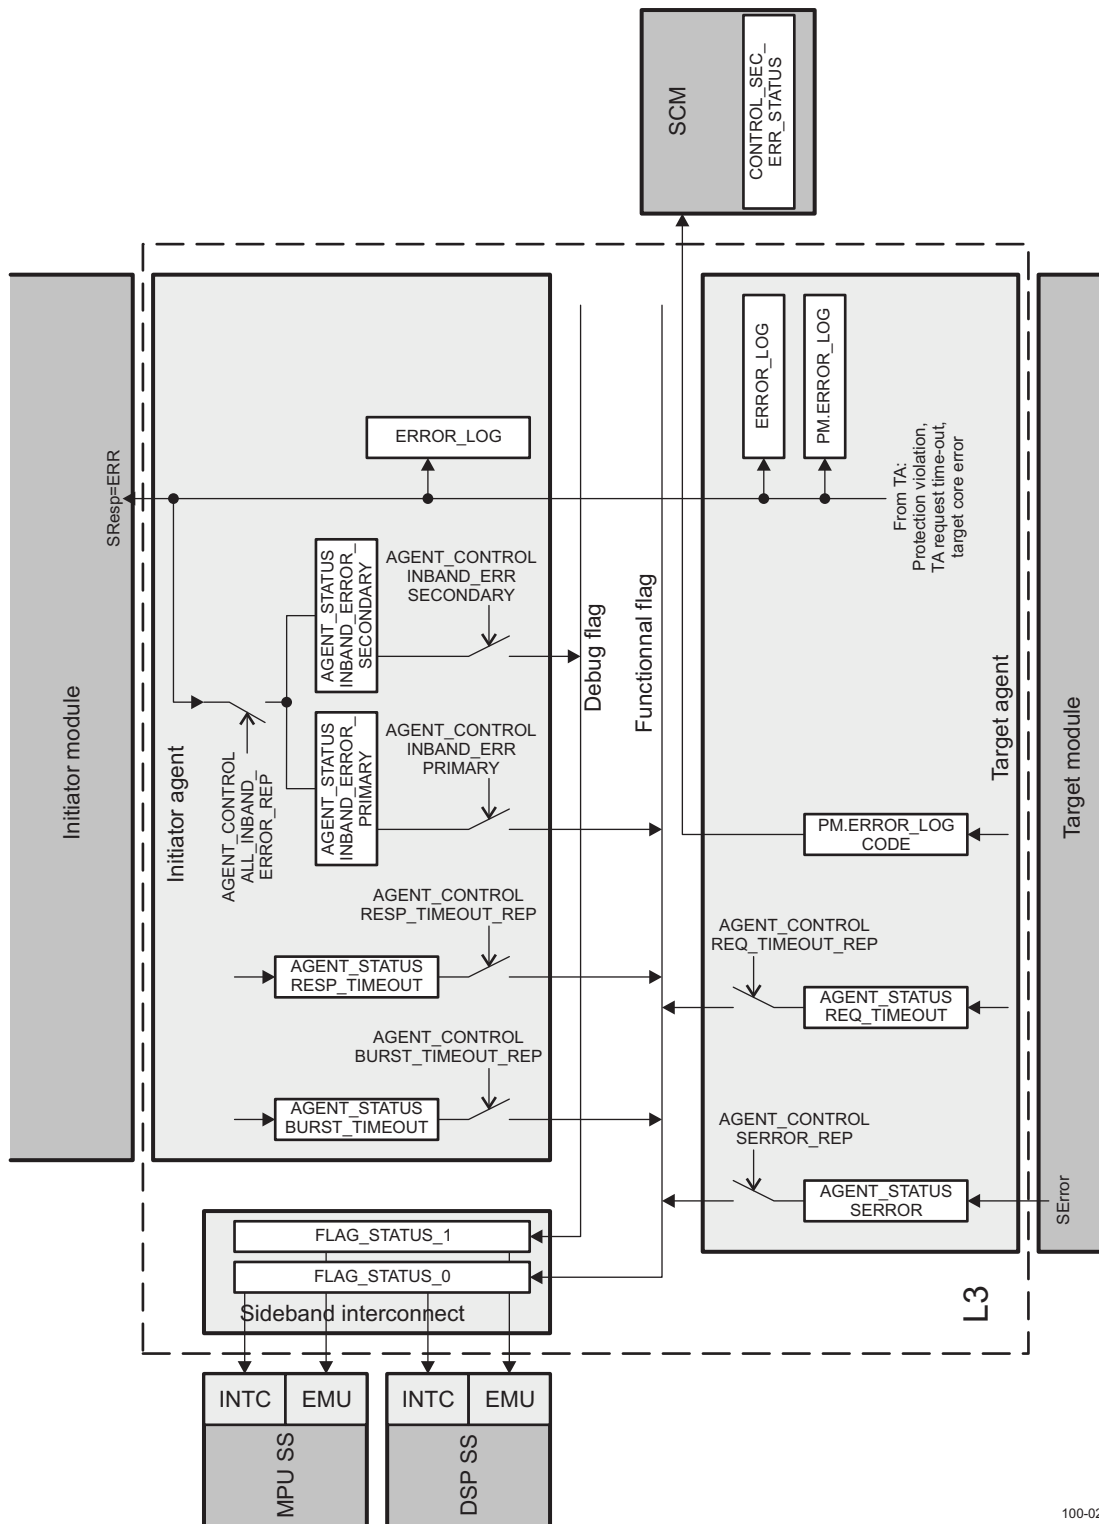

The L3 interconnect provides mechanisms for the detection, logging, and distribution of module-detected and internal interconnect errors. Hardware support is provided to assist in logging errors and cleaning up the state to allow error recovery software to run.

Two types of errors are identified by the L3 interconnect:

- Errors detected by modules and passed along by the interconnect:
 - SResp error: Using the SResp in-band qualifier from the target, the initiator is informed that its request was unsuccessful (see [Table 5-3](#)). This error is nonspecific and further analysis is required to find its cause.
 - SError: This out-of-band qualifier reports that the target is denied service due to an internal cause. No further analysis can be done in the L3 itself.
- Errors detected by the L3 interconnect:
 - Unsupported command: This error reports that the initiator sent a command that cannot be processed, because the target cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
 - Address hole: This error reports an unknown address for a request. The address map is local to each IA; therefore, an address hole error is reported each time an initiator requests an access to a target it is not logically connected to, even if this address exists in the global L3 address map. This error is detected only once per burst.
 - Protection violation: This error indicates a request was rejected by a firewall.
 - Requests time-out: This error reports that the target did not accept (if no response expected) or did not respond to the request presented by the interconnect TA. In this case, all new requests to this TA are answered with SResp = ERR. If the time interval for any request exceeds the time-out period, a time-out occurs. the target stops servicing requests.
 - Response time-out: This error reports that the initiator did not accept response from the interconnect IA in the correct time interval (applies only to masters that have response flow control capabilities). In this case, the IA sends burst close transactions to TAs that have open transactions from this IA. Any new request from this initiator is refused.
 - Burst open time-out: This error reports that a burst or ReadEx/Write pair has been started to the interconnect IA by initiator but did not finish in the correct time interval. If the time interval for any command exceeds the time-out period, a time-out occurs. The initiator does not complete a burst or ReadEx/Write pair. The interconnect IA then closes the transaction by a burst close transaction, to allow traffic from other initiators to resume. Burst close is logged in the interconnect TA when received.

[Figure 5-7](#) shows a global view of the register link to the error reporting structure in an initiator and the target agents.

Figure 5-7. L3 Error Reporting Structure

100-023

Most errors are reported to the IA that originated the request, except for the following:

- Initiator time-outs are reported only out-of-band. Any time-out in the IA results in flagging it as unavailable. A software reset of the agent is required to accept any new requests from the attached core.

- Posted write request, because the IA immediately generates a valid response to the initiator core. This error is only in out-of-band.

Table 5-25 lists where the errors are detected and logged.

Table 5-25. Error Types

Error	Detection	Logging	In-Band Report	Out-of-Band Report
SResp error	None needed	At IA	Yes ⁽¹⁾	Yes
SError assertion from target	None needed	At TA	No	Yes
Unsupported command	At IA	At IA	Yes	Yes
Address hole	At IA	At IA	Yes	Yes
Protection violation	At TA	At protection mechanism agent	Yes ⁽¹⁾	Yes
Request time-out	At TA	At TA	No	Yes
Response time out	At IA	At IA	No	Yes
Burst time-out	At IA	At IA	No	Yes

⁽¹⁾ In case of a posted write, errors cannot be reported in-band.

The time-out errors (request/response and burst) are persistent and require the software to reset both the module and the agent. No request can be processed in the agent until the reset is performed.

Other errors affect only the current request. Subsequent requests are treated normally. Errors are logged, however, and the information about the error used for debugging is kept until the software acknowledges the error.

Table 5-26 lists the information logged for each error code. Information logged in the two error-logging registers (L3_IA_ERROR_LOG, L3_IA_ERROR_LOG_ADDR, L3_TA_ERROR_LOG and L3_TA_ERROR_LOG_ADDR for each IA and TA) depends on the error itself. The CODE field ERROR_LOG[27:24] identifies the type of error occurring for the IA and TA.

Table 5-26. CODE Field Definition

CODE[3:0]	Error Type	Type of Agent			Information Logged				
		IA	TA	PM	REQ_INFO	Secondary	InitiatorID	CMD	Address
0	No error	x	x						
1	Unsupported command	x			x	x	x	x	x
2	Address hole	x			x	x	x	x	x
3	Protection violation			x	x		x	x	
4	In-band error	x				x	x		
5	Not used								
6	Not used								
7	Request time-out not accepted		x		x		x	x	x
8	Request time-out, no response		x				x		
9-15	Not used								

5.2.3.4.2 Time-Out

A time-out mechanism can be enabled in the target agent and initiator agent register. When the mechanism is enabled for a target agent or initiator agent and commands are not accepted or responses are not returned within the expected delay, the L3 interconnect generates an error event.

The error is logged in the target agent REQ_TIMEOUT bit [L3_TA_AGENT_STATUS\[8\]](#) for a target agent time-out, the BURST_TIMEOUT bit [L3_IA_AGENT_STATUS\[16\]](#) bit for an initiator burst time-out, and the RESP_TIMEOUT bit [L3_IA_AGENT_STATUS\[8\]](#) for an initiator response time-out. The affected agent enters an error state that causes it to send error responses to any new request. To recover from this state, the target agent must be reset by system software.

The time-out is counted starting from the moment a command is presented to the target, whatever the target response to this command is. The L3 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected target agents. These four signals are referred to as 1x time-base, 4x time-base, 16x time-base, and 64x time-base.

The time-base circuit offers four possible sets of four time-base signals selected by programming the TIMEOUT_BASE field [L3_RT_NETWORK_CONTROL\[10:8\]](#). [Table 5-27](#) lists all of the values in the number of L3 clock cycles.

Each target agent can be programmed to refer to one of the four time-base signals. A time-out condition is detected when either the command acceptance or the response is not received after a delay of between one and three time-base periods. After the time-out is detected and logged, the behavior of the attached module is ignored. A new request to the module arriving at the timed-out target agent receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, the software is assumed to reset first the faulty module using its internal soft-reset bit, and then the agent using software reset.

Table 5-27. L3 Timeout Register Target and Agent Programming

REQ_TIMEOUT[2:0], BURST_TIMEOUT[2:0], and RESP_TIMEOUT[2:0]					
TIMEOUT_BASE[2:0]	0	1	2	3	4
0	All L3 time-out features are disabled.				
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16384
3		1024	4096	16384	65536
4		4096	16384	65536	262144

5.2.3.4.3 Error Steering

The error reporting structure consist of errors logged individually in the initiator or TAs. Some errors can be enabled and reported out-of-band by setting the following bits to 1:

- [L3_IA_AGENT_CONTROL.BURST_TIMEOUT_REP](#) bit for burst time-out
- [L3_IA_AGENT_CONTROL.RESP_TIMEOUT_REP](#) bit for response time-out
- [L3_TA_AGENT_CONTROL.REQ_TIMEOUT_REP](#) bit for request time-out
- [L3_TA_AGENT_CONTROL.SERROR_REP](#) bit for request time-out

Setting the [L3_IA_AGENT_CONTROL.ALL_INBAND_ERROR_REP](#) bit causes all in-band errors returned to the IA to be reported out-of-band.

IAs connected to processors capable of generating the debug-flagged requests (the MPU and IVA2.2 subsystems) use error steering. Any error linked to an application (nondebug) request is qualified as primary; any error linked to a debug request is qualified as secondary. Setting the [IA.INBAND_ERROR_PRIMARY_REP](#) or [INBAND_ERROR_SECONDARY_REP](#) bit to 1 allows the reporting of in-band to out-of-band primary and secondary errors.

The level of the current error is indicated in SECONDARY bit [L3_IA_ERROR_LOG\[30\]](#). If an error occurs while another error is pending, the following occurs:

- If the pending error is primary, the new error is discarded at the IA level. MULTI bit [L3_IA_ERROR_LOG\[31\]](#) is set in the initiator error log register to indicate that another error has been detected; no further information can be stored.
- If both the pending error and the new error are secondary, the latest error is discarded and MULTI bit [L3_IA_ERROR_LOG\[31\]](#) is set.

- If the pending error is secondary and the incoming error is primary, MULTI bit [L3_IA_ERROR_LOG](#)[31] is set and all useful information about the new error (MCmd, MAddr, MReqInfo, etc.) is stored. All information relative to the secondary error is discarded.

For protection violation, errors are detected at the TA and steered to the control module (see [Section 5.2.3.3.7](#), *L3 Firewall and System Control Module*).

5.2.3.4.4 Global Error Reporting

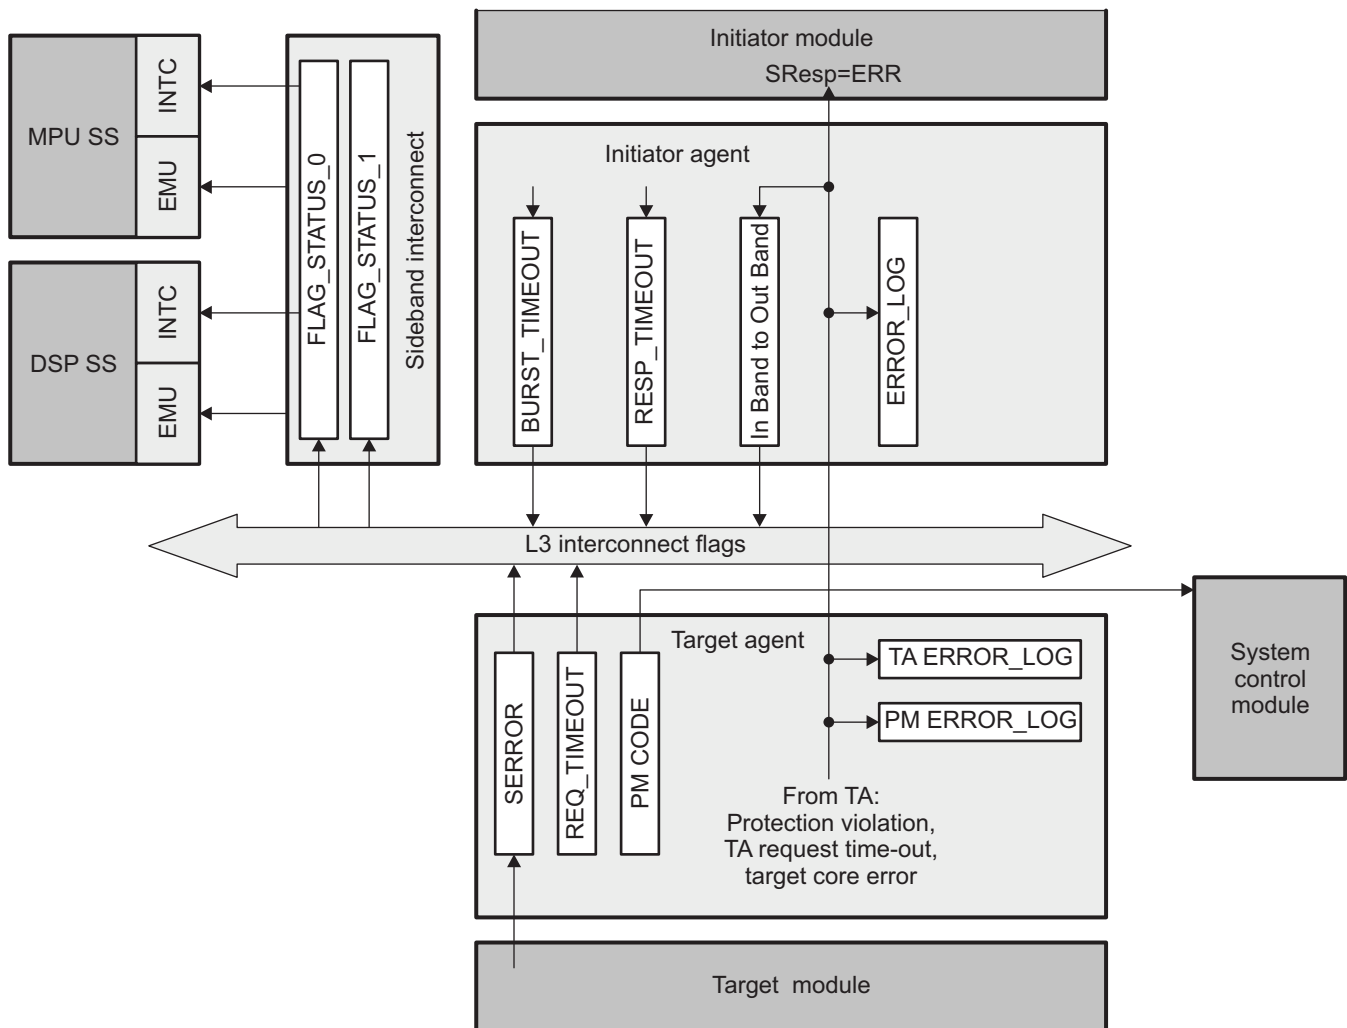

An out-of-band error refers to any flag output from the L3. It is not a formal error in the sense that it is not processed directly by the interconnect module; however, it is interpreted as such by one or several processors, typically by mapping it to an interrupt controller. All L3 out-of-band errors are ORed together and the result is transmitted to one or several interrupt controllers. All out-of-band errors are active high and must be acknowledged through a register access to be deasserted.

Out-of-band errors are reported through error or flag signals, asynchronously to any other data flow, but synchronously to the clock.

All errors are reported out-of-band to the IVA2.2 and MPU subsystems simultaneously. The processors must check whether an error is relevant to the subsystems. These errors are routed not only to the IVA2.2 and MPU subsystem interrupt controllers, but also to their emulation logic (see [Figure 5-8](#)). Two composite flags help in asserting the error origin and criticality:

- The L3 application error flag reports application or nonattributable (not related to a request such as a time-out, SError) errors.
- The L3 debug error flag reports debug errors.

Figure 5-8. Global Error Routing

100-011

In addition to the SResp qualifier error reporting, some external targets use an SError signal to indicate that an internal error has occurred. Some resetting action may be required before any new request can be accepted, depending on the module and on the error itself. These signals are routed as flags internally to the L3. Table 5-28 lists the possible errors reported through an SError, propagated externally to the L3 interconnect, and aggregated to the L3 application error flag.

Table 5-28. L3 External Input Flags

Target	Flag	Description	Software Visible?
GPMC	SError	General-purpose error occurs in GPMC module	Yes, in FLAG_STATUS register and in L3 TA SERROR bit AGENT_STATUS[24]

NOTE: The user must ensure that the corresponding IRQ lines are set correctly in the interrupt controllers of the MPU and IVA2.2 subsystems.

Figure 5-9 shows the routing of errors to the application and debug error composite flags. Because both debug capable processors, the MPU and IVA2.2 subsystems have access to the full error report mechanism; they can be debugged independently of one another.

Figure 5-9. L3 Error Routing

100-005

Table 5-29 lists the bit and source for the STATUS bit field `L3_SI_FLAG_STATUS_0[63:0]` for an application error, and Table 5-30 lists the bit and source for the STATUS bit field `L3_SI_FLAG_STATUS_1[63:0]` for an application error for a debug error.

Protection errors are reported in-band to the IA when possible. This may not be possible for posted writes, however. These errors are also reported asynchronously to the module.

Additionally, all protection errors (even posted writes) are seen by the in-band-to-out-of-band conversion logic in the IAs. Therefore, all protection errors feed into the L3 application error and L3 debug error composite flags, and hence back to the MPU and IVA2.2 subsystems.

The SMS, L4-Core, L-4 Per, and L4-Emu interconnects have internal firewalls that use the same reporting scheme. These errors are not routed directly to the L3 interconnect but are reported in-band to the initiator, which routes them to the composite flags. The SMS, L4-Core, L4-Per, and L4-Emu interconnects always provide an error on the in-band SResp qualifier for protection violations.

Table 5-29. L3_SI_FLAG_STATUS_0 for Application Error

5.2.4 L3 Interconnect Basic Programming Model

5.2.4.1 General Recommendation

The L3 interconnect registers must be read or written with little-endian attributes; otherwise, the result is undefined.

CAUTION

Overlapping between protection regions with the same priority level leads to unpredictable behavior and must be avoided.

5.2.4.2 Initialization

At the release of power on reset, the L3 firewall default configuration enables all accesses to target modules, except for a section of the OCM ROM.

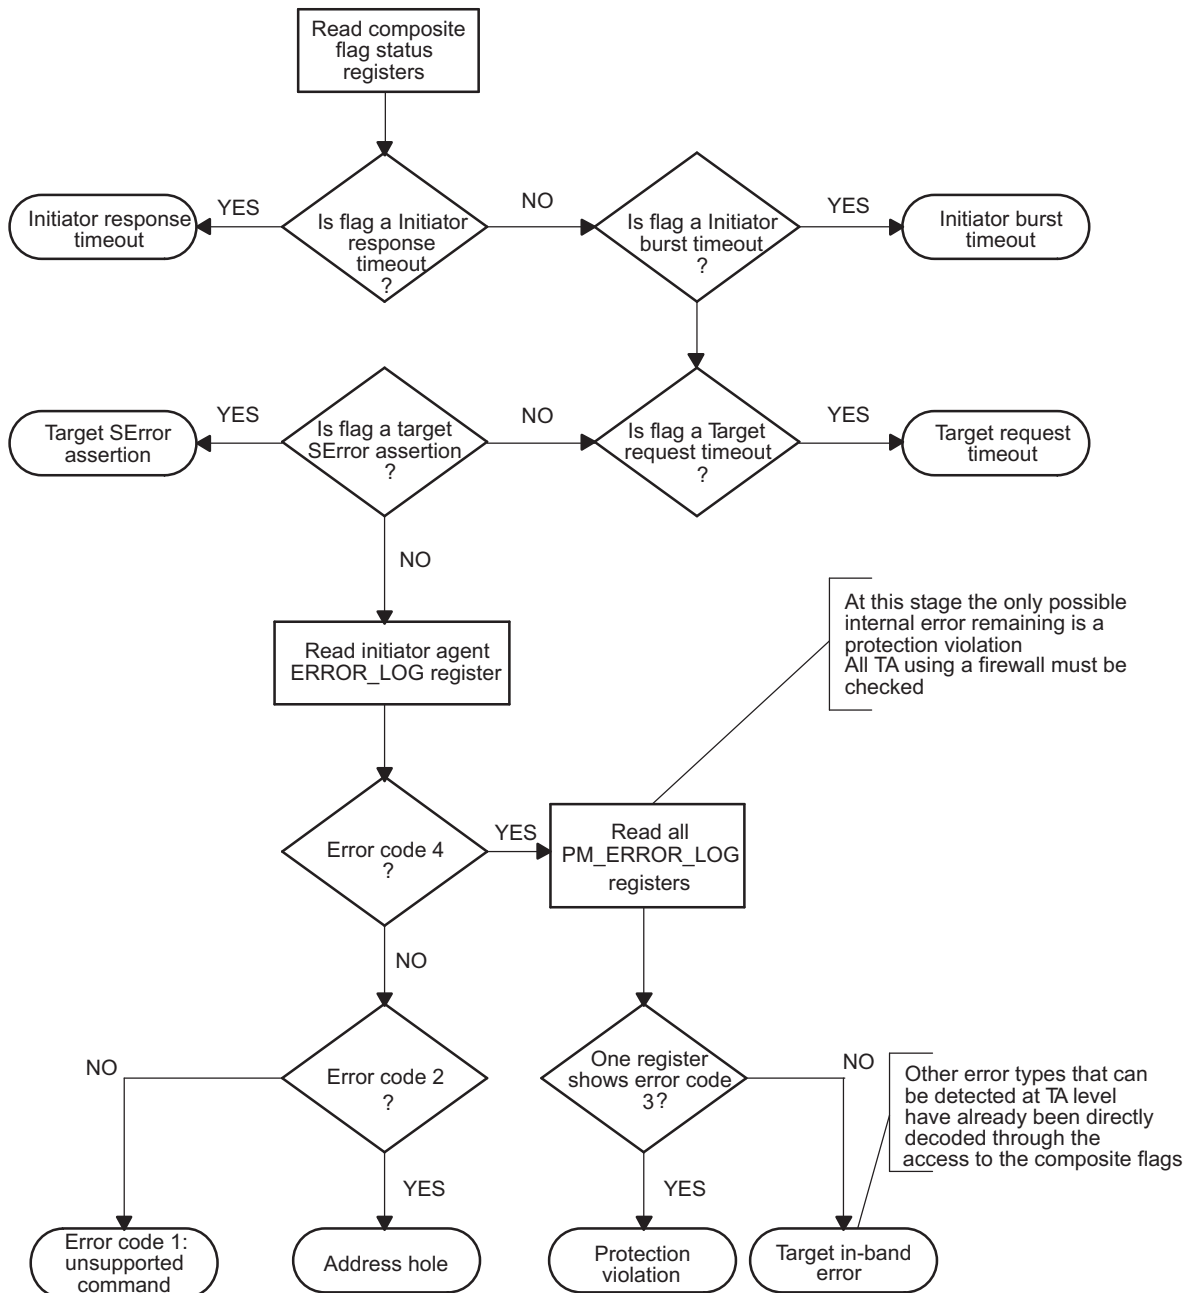

Generally, software must configure the firewall properly to avoid poor use of the hardware resources.

L3 time-out capabilities are also disabled at reset.

5.2.4.3 Error Analysis

The information required to analyze an error source is logged in several registers (see [Table 5-26](#)). The number of registers to access depends on the error source. When investigating the origin of an error, software reads a set of error log registers. At each stage, the register either states the current error or points to the next agent in which the error is logged. [Figure 5-10](#) shows the software sequence required in most cases.

Figure 5-10. Typical Error Analysis Sequence

100-012

Errors that do not result from an in-band to out-of-band conversion can be extracted immediately from the application or debug error flag by reading the STATUS field [L3_SI_FLAG_STATUS_0\[63:0\]](#) and [L3_SI_FLAG_STATUS_1\[63:0\]](#) register; therefore, they do not require the whole analysis sequence shown in [Table 5-26](#).

When analysis leads to a TA error, software must read the initiator agent ADDR field [L3_IA_ERROR_LOG_ADDR\[39:0\]](#) to extract the TA address causing the error.

5.2.4.3.1 Time-Out Handling

This section gives information about all modules and features in the high-tier device. See [Section 1.5, OMAP35xx Family](#), to check availability of modules and features. To flag interconnect response being blocked, the time-out of target agents attached to unavailable modules can be enabled with the lowest setting.

Example 1

In this example, the MPU interrupt handler detects an error from the L3 interconnect. A read access from the [L3_SI_FLAG_STATUS_0](#) register reports a value of 0x40000. As described in [Table 5-29](#), the error detected is a burst time-out from the sDMA read port.

As with any time-out error, the affected module is now considered to be out-of-service. If necessary, the error can be cleared by sending a soft reset command to the agent (set `CORE_RESET` bit [L3_IA_AGENT_CONTROL\[0\]](#) to 1, and then to 0). During this time the initiator is off-line. Although the rest of the system still behaves normally, a time-out error is usually severe enough to require a complete reset of the chip.

Before resetting the agent or the system, the error log registers can learn the status of the interconnect and determine the type of failure. Reading the `IA_SDMA_RD.L3_IA_AGENT_STATUS` register shows whether the time-out was detected during a burst or during a read/write sequence.

Example 2

In this example, the MPU interrupt controller detects an error from the L3 interconnect. A read access from the [L3_SI_FLAG_STATUS_0](#) register reports a value of 0x100. This is a functional error from the IVA2.2 subsystem initiator.

The `IA_IVA2.2.L3_IA_ERROR_LOG` register should be read next. The value stored in it is 0x12_0400_1302.

- `CMD` field `IA_IVA2.2.L3_IA_ERROR_LOG[2:0]`: Value 0x2. Not applicable for an in-band error.
- `INITID` field `IA_IVA2.2.L3_IA_ERROR_LOG[15:8]`: Value 0x13. The origin of the error is the IVA2.2 subsystem sDMA.
- `CODE` field `IA_IVA2.2.L3_IA_ERROR_LOG[27:24]`: Value 0x4. Error is an in-band error.
- `SECONDARY` bit `IA_IVA2.2.L3_IA_ERROR_LOG[30]`: Value 0x0. The error is functional.
- `MULTI` bit `IA_IVA2.2.L3_IA_ERROR_LOG[31]`: Value 0x0. No additional error has been detected.
- `REQ_INFO` field `IA_IVA2.2.L3_IA_ERROR_LOG[43:32]`: Value 0x12. Not applicable for an in-band error.

There is no simple way to determine which target originated the in-band error. An SError assertion or a request time-out would have been detected and logged in the [L3_SI_FLAG_STATUS_0](#) register. Because no such error is asserted (bits 60:48 are still 0), the error can only be a firewall error or have originated in the target itself. The user must read all of the `PM_XXX.L3_PM_ERROR_LOG` registers.

CAUTION

The PM register blocks are sensitive registers and are usually protected. Ensure that the processor used to debug the error is allowed to access these registers. If not, the access will be rejected and another error will be generated.

All `PM_XXX.L3_PM_ERROR_LOG` registers are clear (bits 27:24 equal 0x0) except for `PM_OCMRAM.L3_PM_ERROR_LOG`, which reads 0x0302_1301. The error occurred while trying to access the OCM RAM.

NOTE: If all `PM_XXX.L3_PM_ERROR_LOG` registers are clear, the error is unrelated to the interconnect. Further analysis must be done in the targets.

- Bits 27:24: Value 0x3. There is a protection error.
- Bits 2:0: Value 0x1. The command was a posted write.

- Bits 6:4: Value 0x0. The address is protected by Region 0 (default region) of the firewall.
- Bits 15:8: Value 0x13. The origin of the error is the IVA2.2, thread 2. This is consistent with the error log on the initiator side, and confirms this error report is the correct one.
- Bits 20:16: Value 0x2. The protection parameters were data, debug, and user.
- Bit 31: Value 0x0. This is the only error detected.

A check on the protection configuration confirms that this access was not allowed, either because the initiator was not given write access or because the protection access parameters were not compatible with the PM_OCMRAM.REQINFO_PERMISSIONS_0 settings.

A protection violation is not terminal from the interconnect point of view. If the module responsible for the global chip protection do not reset the system (including the IVA2.2 subsystem and the OCM RAM), it continues to run normally. A simple clearing of the error on both the IA and PM sides is required to return to a clean status.

5.2.4.3.2 Acknowledging Errors

Time-out errors can never be acknowledged. To return to a normal operation after an error, the faulty agent must be reset. An agent can be reset by asserting CORE_RESET bit [L3_IA_AGENT_CONTROL\[0\]](#) or [L3_TA_AGENT_CONTROL\[0\]](#), or by resetting the L3 interconnect through the PRCM.

Functional errors, including an in-band signal reporting a protection error, must be inactivated through software. Setting the INBAND_ERROR_PRIMARY and INBAND_ERROR_SECONDARY bits [L3_IA_AGENT_STATUS\[28-29\]](#) in an IA, or setting the SERROR bit [L3_IA_AGENT_STATUS\[24\]](#) in a TA clears the reported error. [Table 5-31](#) lists the bit to clear and the associated type of error.

The [L3_IA_ERROR_LOG](#) or [L3_TA_ERROR_LOG](#) register must also be cleared by writing a nonzero value simultaneously to the CODE bit field and the values currently stored in the MULTI and SECONDARY fields.

Table 5-31. Error Clearing

Agent Type	Error	Register Field
Initiator	In-band primary (application) error	INBAND_ERROR_PRIMARY
	In-band secondary (debug) error	INBAND_ERROR_SECONDARY
Target	Target asserts SError	SERROR

The procedure to clear protection errors depends on the system protection configuration:

- Write a nonzero value simultaneously into CODE bit field [L3_PM_ERROR_LOG\[27:24\]](#) and the value currently stored in the MULTI bit [L3_PM_ERROR_LOG\[31\]](#) of the corresponding PM register block.
- Alternately, read either [L3_PM_ERROR_CLEAR_SINGLE](#) or [L3_PM_ERROR_CLEAR_MULTI](#), depending on the current value of the MULTI field in the [L3_PM_ERROR_LOG](#) register. This solution, which allows the clearing of protection errors without having a write access on other protection registers, preserves protection.

[L3_SI_FLAG_STATUS_0](#) or [L3_SI_FLAG_STATUS_1](#) must be checked at the end of any error acknowledging sequence to confirm that the acknowledgement was successful and that no other error is pending.

5.2.4.4 Typical Example of Firewall Programming Example

All four regions in the IVA2.2 target firewall can be configured with no restrictions. However, protection is required for a 14K-byte region starting at address 0x0 in address space 2, and it must accept any access from any initiator for the rest of the target. The protection restricts allowed accesses as follows:

- Only the IVA2.2 and the MPU can read from this memory.
- Only the MPU can write to this memory.
- The protection parameters must include supervisor and functional.

Only accesses declared as supervisor and functional are allowed to pass through the protected region of the firewall. There is no restriction on other attributes.

Table 5-32 lists the possible parameter combinations, whether they are allowed to pass or not, and why they are rejected.

Table 5-32. MReqInfo Parameter Example

Reqbit	MReqInfo				
	MReqSupervisor	MReqDebug	MReqType	Access Allowed	Reason for Rejection
0	User	Functional	Data	No	Not supervisor
1	User	Functional	Code	No	Not supervisor
2	User	Debug	Data	No	Not supervisor
3	User	Debug	Code	No	Not supervisor
4		Reserved for non-GP devices		No	
5		Reserved for non-GP devices		No	
6		Reserved for non-GP devices		No	
7		Reserved for non-GP devices		No	
8	Supervisor	Functional	Data	Yes	
9	Supervisor	Functional	Code	Yes	
10	Supervisor	Debug	Data	No	Not functional
11	Supervisor	Debug	Code	No	Not functional
12		Reserved for non-GP devices		No	
13		Reserved for non-GP devices		No	
14		Reserved for non-GP devices		No	
15		Reserved for non-GP devices		No	

Only combinations with codes 8 and 9 are allowed to access a target. REQ_INFO field PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i[15:0] for the protected region must be set to (0x8) | (0x9); that is, 0x0300.

Solution 1

Set Region 0 to accept all accesses:

- PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i (i=0)= 0xFFFF
- PM_IVA2.2.L3_PM_READ_PERMISSION_i (i=0)= 0x140E
- PM_IVA2.2.L3_PM_WRITE_PERMISSION_i (i=0)= 0x140E

Set Region 1 to cover the first 8K bytes of the protected region:

- PM_IVA2.2.L3_PM_ADDR_MATCH_k (k=1) = 0x22 (start address 0x0, size 8K bytes, address space 2)
- PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i (i=1) = 0x0300
- PM_IVA2.2.L3_PM_READ_PERMISSION_i (i=1) = 0x0406 (IVA2.2 DMA and MMU and MPU are allowed)
- PM_IVA2.2.L3_PM_WRITE_PERMISSION_i (i=1) = 0x0002 (only MPU is allowed to write)

Set Region 2 to cover the next 4K bytes:

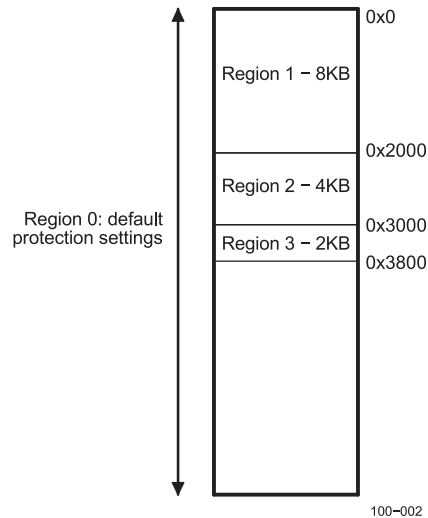

- PM_IVA2.2.L3_PM_ADDR_MATCH_k (k=2) = 0x201A (start address 0x2000, level 1, size 4K bytes, address space 2)
- PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i (i=2) = 0x0300
- PM_IVA2.2.L3_PM_READ_PERMISSION_i (i=2) = 0x0406
- PM_IVA2.2.L3_PM_WRITE_PERMISSION_i (i=2) = 0x0002

Set Region 3 to cover the last 2K bytes:

- PM_IVA2.2.L3_PM_ADDR_MATCH_k (k=3)= 0x3012 (start address 0x3000, level 1, size 2K bytes, address space 2)
- PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i (i=3) = 0x0300
- PM_IVA2.2.L3_PM_READ_PERMISSION_i (i=3) = 0x0406
- PM_IVA2.2.L3_PM_WRITE_PERMISSION_i (i=3) = 0x0002

Figure 5-11 shows the firewall configuration for Solution 1.

Figure 5-11. Firewall Configuration Solution 1

Solution 2

Set Region 0 to accept all accesses:

- `PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i` (i=0) = 0xFFFF
- `PM_IVA2.2.L3_PM_READ_PERMISSION_i` (i=0) = 0x140E
- `PM_IVA2.2.L3_PM_WRITE_PERMISSION_i` (i=0) = 0x140E

Set Region 2 to cover 16K bytes:

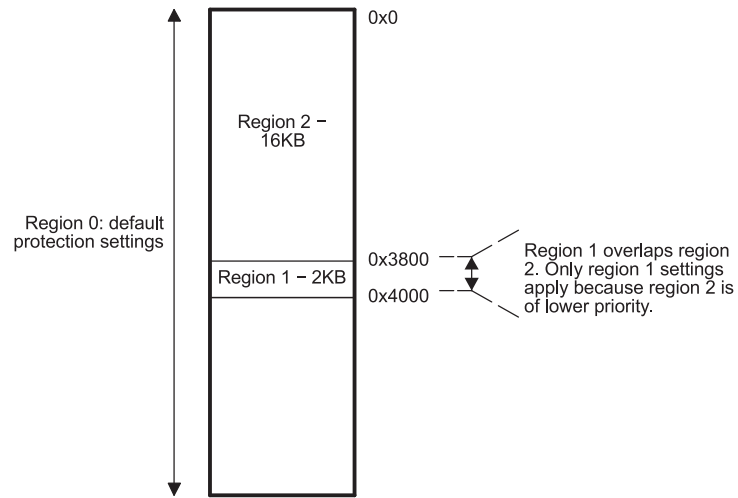

- `PM_IVA2.2.L3_PM_ADDR_MATCH_k` (k=2) = 0x2A (start address 0x0, level 1, size 16K bytes, address space 2)
- `PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i` (i=2) = 0x0300
- `PM_IVA2.2.L3_PM_READ_PERMISSION_i` (i=2) = 0x0406 (IVA2.2 DMA and MMU and MPU are allowed)
- `PM_IVA2.2.L3_PM_WRITE_PERMISSION_i` (i=2) = 0x0002 (only MPU is allowed to write)

Set Region 1 to mask the last 2K bytes:

- `PM_IVA2.2.L3_PM_ADDR_MATCH_k` (k=2) = 0x3812 (start address 0x3800, size 2K bytes, address space 2)
- `PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i` (i=1) = 0xFFFF
- `PM_IVA2.2.L3_PM_READ_PERMISSION_i` (i=1) = 0x042E
- `PM_IVA2.2.L3_PM_WRITE_PERMISSION_i` (i=1) = 0x042E

Figure 5-12 shows the firewall configuration for Solution 2.

Figure 5-12. Firewall Configuration Solution 2

5.2.5.1 L3 Initiator Agent (L3 IA)

This section describes the IA register block. Each IA in L3 interconnect has its own IA register block.

The following are the IA registers:

- MPU subsystem port
- IVA2.2 subsystem port
- SGX subsystem port
- High-Speed USB Host
- High-Speed USB OTG
- System DMA read port
- System DMA write port
- Display subsystem port
- Camera subsystem port
- DAP port
- Die-to-die

Table 5-34 through Table 5-37 list the IA registers and their physical addresses, depending on the module instance.

Table 5-34. Initiator Agent Common Register Summary

Register Name	Type	Register Width (Bits)	Address Offset	IA_MPUSS Physical Address	IA_IVA2.2 Physical Address	IA_SGX Physical Address

5.2.5.2 L3 Target Agent (L3 TA)

This section describes the TA register block. Each TA in L3 interconnect has its own register block.

The following are the TA registers:

- SDRAM memory scheduler (TA_SMS module)
- General-purpose memory controller (TA_GPMC module)
- On-chip memory RAM (TA_OCM_RAM module)
- On-chip memory ROM (TA_OCM_ROM module)
- Master D2D (TA_MAD2D module)
- IVA2.2 subsystem (TA_IVA2.2 module)
- SGX subsystem (TA_SGX module)
- L4-Core interconnect (TA_L4_CORE module)
- L4-Per interconnect (TA_L4_PER module)
- L4-Emu interconnect (TA_L4_EMU module)

Table 5-50 through Table 5-53 lists all initiator target registers and their physical addresses depending on the module instance.

Table 5-54 through Table 5-64 describe the individual common registers in the module instance.

Table 5-50. Target Agent Common Register Summary

5.2.5.4 Protection Mechanism (PM)

This section describes the protection mechanism register block.

The following are the protection mechanism registers:

- Register target (PM_RT module)
- General-purpose memory controller (PM_GPMC module)
- On-chip RAM (PM_OCM_RAM module)
- On-chip ROM (PM_OCM_ROM module)
- IVA2.2 subsystem (PM_IVA2.2 module)

Table 5-75 and Table 5-77 list the protection registers and their physical addresses, depending on the module instance.

Table 5-78 through Table 5-88 describe the individual common registers in the module instance.

Table 5-75. Protection Mechanism Common Register Summary

Register Name	Type	Register Width (Bits)	PM_RT Physical Address	PM_GPMC Physical Address

5.3 L4 Interconnects

5.3.1 Overview

To connect peripheral modules, the device uses four separate L4 interconnect structures. Although all L4 interconnects handle transfers with peripherals, the interconnects are in different power domains. The L4 interconnect is composed of the following:

- L4-Core: Includes the majority of the peripherals and the configuration interface for L3 interconnect system modules
- L4-Per: Includes peripherals that do not need to be mapped in the CORE power domain
- L4-Wakeup: Includes the peripherals attached to the WKUP power domain
- L4-Emu: Includes emulation peripherals attached to the EMU power domain

The following are the main features of the L4 interconnects:

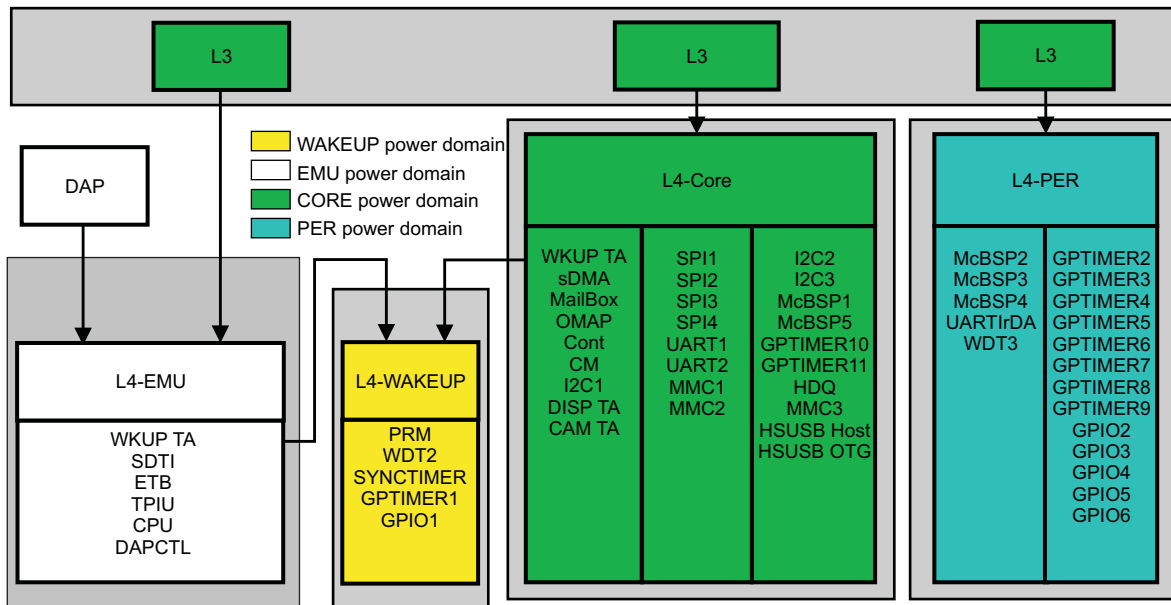

- Single port to connect to L3 interconnect
 - L4-Core
 - L4-Per
- Dual ports for the following:
 - L4-Emu to connect to the L3 interconnect and DAP
 - L4-Wakeup to connect to the L4-Core and L4-Emu
- Single 32-bit initiator for the L3 port
- Multitarget ports (one per target interface on the L4 interconnect)
- 8-, 16-, or 32-bit data, single, or burst transactions
- Little-endian
- Nonblocking with fair arbitration between threads
- Peripherals are not burst-capable; the system initiators can address bursts to them, but the L4 interconnect breaks the bursts into single accesses.
- Target interfaces: Fully synchronous or divided synchronous
- Peak bandwidth of L4 interconnect is 1 MBps × L4 frequency in MHz per L4 thread (that is, 83 MBps, when the L4 frequency is 83 MHz).
- Latency: Three cycles on request, one cycle on response
- Protection logic provides user-configurable access control to targets by each initiator:
 - Firewall in L4-Core protects the core and wake-up peripherals.
 - Firewall in L4-Per protects per peripherals.
 - Firewall in L4-Emu protects emulation and wake-up peripherals

NOTE: L4-Wakeup has two input ports from L4-Core and L4-Emu. Therefore, wake-up peripherals appear in two locations in the memory mapping. Normally, L4-Emu limits its access except when debugging.

NOTE: L4_CORE has four threads (maximum), L4_PER has four threads (maximum), and L4_EMU and L4_WKUP have one thread.

Figure 5-13 shows an overview of the L4 interconnects and the peripherals attached to them.

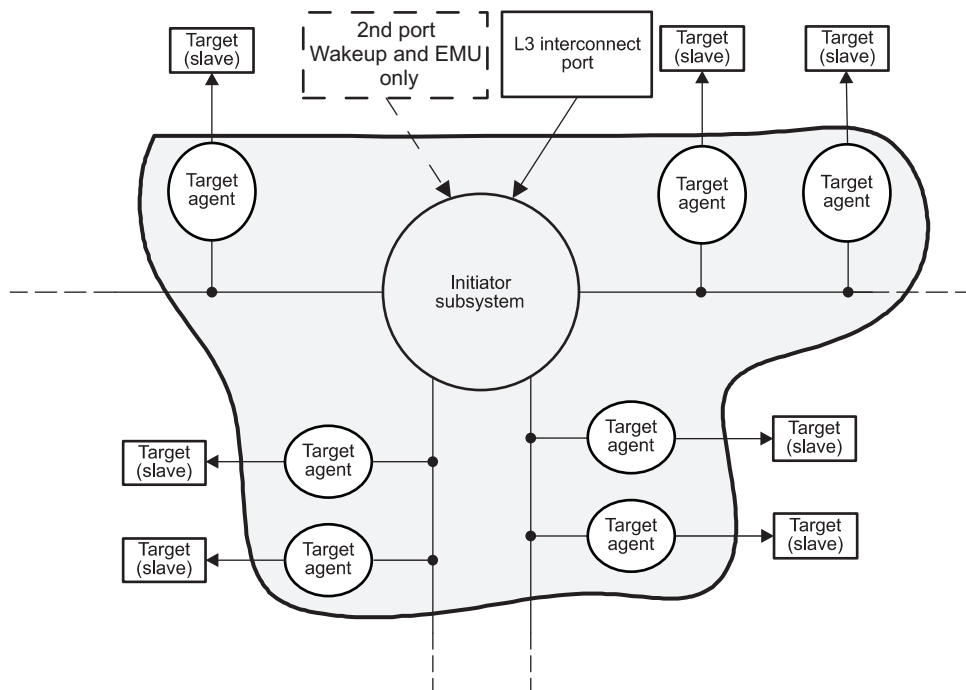

Figure 5-13. L4 Interconnect Overview

INTERCONNECT_SWPU108-public-019

Figure 5-14 shows an internal view of the L4 interconnects in the overall interconnect. This architecture, with only one initiator module (the initiator subsystem) distributing transactions to all target modules (peripherals), enables the firewall functions of the L4 interconnects to be centralized at the L4 initiator level. The L4 firewall filters the accesses according to the configurable protection groups defined in the L4 address protection (AP) registers. Each module or agent is assigned to a protection group. Configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

Figure 5-14. L4 Initiator-Target Connectivity for L4-Core and L4-Per

100-010

NOTE: As [Figure 5-14](#) shows, targets are attached to branches. These branches have no functional effect and are present for timing closure reasons only.

5.3.1.1 L4-Core Interconnect

The L4-core interconnect handles only transfers to peripherals in the CORE power domain. [Table 5-104](#) lists the TAs.

Table 5-104. L4-Core Target Agents

Module Name	Description
Display subsystem	Display subsystem configuration port
Camera subsystem	Camera subsystem port
USBHS OTG	Universal serial bus High-Speed port OTG
USBHS Host	Universal serial bus High-Speed port Host
USBTLL	USB Transceiver Less Link
UART1	Universal asynchronous receiver transmitter port 1
UART2	Universal asynchronous receiver transmitter port 2
I2C1	Multimaster inter-integrated circuit 1
I2C2	Multimaster inter-integrated circuit 2
I2C3	Multimaster inter-integrated circuit 3
McBSP1	Multichannel buffered serial port 1
McBSP5	Multichannel buffered serial port 5
GPTIMER10	General-purpose timer 10
GPTIMER11	General-purpose timer 11
SPI1	Serial peripheral interface 1
SPI2	Serial peripheral interface 2
MMCHS1	Multimedia memory controller SDIO 1
MMCHS2	Multimedia memory controller SDIO 2
MMCHS3	Multimedia memory controller SDIO 3
HDQ/1-Wire	Single wire serial link low rate
MLB (mailbox)	Mailbox
SPI1	Serial peripheral interface 1
SPI2	Serial peripheral interface 2
SPI3	Serial peripheral interface 3
SPI4	Serial peripheral interface 4
sDMA	System DMA controller
L4-Wakeup	L4-Wakeup interconnect
CM	Clock manager
SCM	System control module

NOTE: A unique port is used for communication between the L3 interconnect and the L4-Core interconnect to allow the L3 initiators to access the L4-Core targets.

For the list of initiators authorized to access the L4-Core peripherals, see [Table 5-14](#). For details on restricted access, see [Section 5.3.3.3.1, Protection Mechanism](#).

5.3.1.2 L4-Per Interconnect

The L4-Per interconnect handles only transfers to peripherals in the PER power domain. [Table 5-105](#) lists the TAs.

Table 5-105. L4-Per Target Agents

Module Name	Description
UARTIrDA	Universal asynchronous receiver/transmitter and infrared data association port
McBSP2	Multichannel buffered serial port 2
McBSP3	Multichannel buffered serial port 3
GPTIMER2	General-purpose timer 2
GPTIMER3	General-purpose timer 3
GPTIMER4	General-purpose timer 4
GPTIMER5	General-purpose timer 5
GPTIMER6	General-purpose timer 6
GPTIMER7	General-purpose timer 7
GPTIMER8	General-purpose timer 8
GPTIMER9	General-purpose timer 9
GPIO2	General-purpose I/O 2
GPIO3	General-purpose I/O 3
GPIO4	General-purpose I/O 4
GPIO5	General-purpose I/O 5
GPIO6	General-purpose I/O 6

NOTE: A unique port is used for communication between the L3 interconnect and the L4-Core interconnect to allow the L3 initiators to access the L4-Per targets.

For the list of initiators authorized to access the L4-Per peripherals, see [Table 5-14](#). For details on restricted access, see [Section 5.3.3.3.1, Protection Mechanism](#).

5.3.1.3 L4-Emu Interconnect

The L4-Emu interconnect handles only transfers to peripherals in the EMU power domain. [Table 5-106](#) lists the TAs.

Table 5-106. L4-Emu Target Agents

Module Name	Description
L4-Wakeup	L4-Wakeup interconnect
SDTI	System debug trace interface
ETB	Embedded trace buffer
TPIU	Trace port interface unit
MPU	ARM9
DAPCTL	Debug access port

Not all initiators can access all the targets in the L4-Emu interconnect. Additional restrictions affect the ability of these initiators to access the L4-Emu peripherals. [Table 5-107](#) lists which initiators can access the L4-Emu interconnect.

NOTE: For the list of initiators authorized to access the L4-Emu peripherals, see [Table 5-14](#). For details on restricted access, see [Section 5.3.3.3.1, Protection Mechanism](#).

Table 5-107. L4-Emu Initiator Agents

Module Name	Description
L3 interconnect	L3 interconnect port
DAP	DAP port

5.3.1.4 L4-Wakeup Interconnect

The L4-Wakeup interconnect handles only transfers to peripherals in the WKUP power domain. [Table 5-108](#) lists the TAs.

Table 5-108. L4-Wakeup Target Agents

Module Name	Description
PRM	Power reset manager
GPIO1	General-purpose I/O 1
GPTIMER1	General-purpose timer 1
WDTIMER2	MPU subsystem watchdog timer
32KTIMER	32-kHz timer

Initiators that can access the L4-Core or L4-Emu can access all the targets in the L4-Wakeup interconnect. [Table 5-109](#) lists the initiators that can access the L4-Wakeup interconnect. For details on restricted access, see [Section 5.3.3.3.1](#), *Protection Mechanism*.

Table 5-109. L4-Wakeup Initiator Agents

Module Name	Description
L4-Core interconnect	L4-Core interconnect port
L4-Emu interconnect	L4-Emu interconnect port

5.3.2 L4 Interconnects Integration

5.3.2.1 Clocking, Reset, and Power-Management Scheme

5.3.2.1.1 Clocks

Four functional clocks are used in each L4 interconnect (see [Table 5-110](#)).

Table 5-110. L4 Interconnect Clocks

Clock	Frequency	Name	Comments
L4-Core interconnect clock	Up to Core_L3_ICLK/2	CORE_L4_GICLK	Source, control, and gating handled by PRCM module
L4-Per interconnect clock	Up to Core_L3_ICLK/2	PER_L4_GICLK	Source, control, and gating handled by PRCM module
L4-Emu clock		L4_EMU	Clock for emulation
L4-Wakeup interconnect clock		WKUP_L4_GICLK	Source, control, and gating handled by PRCM module

5.3.2.1.2 Resets

5.3.2.1.2.1 Hardware Reset

L4 interconnects receive a reset signal from the PRCM module, which is the reset signal to the CORE power domain. For more details, see [Chapter 4, Power, Reset, and Clock Management](#).

[Table 5-111](#) lists the hardware reset for the L4-Core interconnect.

Table 5-111. L4 Interconnect Hardware Reset

Interconnect	Reset Domain
L4-Core interconnect	CORE_RST
L4-Per interconnect	PER_RST
L4-Wakeup interconnect	WKUP_RST
L4-Emu interconnect	EMU_RST

5.3.2.1.2.2 Software Reset

The L4 interconnects have hardware reset capabilities, but do not have software reset capabilities. The hardware reset capabilities are controlled by the PRCM module and are applied to the L4 interconnects and the connected L4 TAs and L4 target modules.

5.3.2.1.3 Power Domain

For more details on power voltage scaling, see [Chapter 4, Power, Reset, and Clock Management](#).

[Table 5-112](#) lists the power domains for the L4-Core and L4-Wakeup interconnects.

Table 5-112. L4 Interconnect Power Domains

Interconnect	Power Domain
L4-Core interconnect	CORE
L4-Per interconnect	PER
L4-Emu interconnect	EMU
L4-Wakeup interconnect	WKUP

5.3.2.1.4 Power Management

5.3.2.1.4.1 Module Power-Saving

The L4 interconnect automatically performs internal clock autogating to reduce power consumption. Though not recommended, it is possible to deactivate clock autogating by writing 1 to the `CLOCK_GATE_DISABLE` bit `L4_LA_NETWORK_CONTROL_H[24]` of each L4 interconnect. Clock autogating is enabled by default.

5.3.2.1.4.2 System Power Management and Wakeup

As part of the system-wide power-management scheme, the L4 interconnect enters an idle state at the request of the PRCM module (for more information, see [Chapter 4, Power, Reset, and Clock Management](#)). The L4 interconnect is always in smart-idle mode; that is, it goes into idle state after receiving the request from the PRCM module once all the transfer requests are complete. This functionality is handled by hardware. The L4 interconnect sends an acknowledge signal back to the PRCM module when it enters idle state.

5.3.3 L4 Interconnects Functional Description

5.3.3.1 L4-Interconnects Initiator Identification

In the device interconnect, a ConnID is an initiator module identifier. The L4 interconnect uses the same ConnID as L3.

5.3.3.2 Endianness Management

Both L4 interconnects are little-endian only. Any initiator accessing the L4 interconnect module must consider byte ordering and perform a conversion, if necessary.

5.3.3.3 L4 Protection and Firewalls

5.3.3.3.1 Protection Mechanism

The following two parameters are used to set up access permission because of the large address spaces and the number of peripherals connected to the L4 interconnects:

- Programmable groups for initiators:
 - 8 protection groups for the L4-Core interconnect
 - 8 protection groups for the L4-Per interconnect
 - 6 protection groups for the L4-Emu interconnect
- Each segment is divided into regions of 2K bytes:
 - 100 regions for the L4-Core interconnect
 - 43 regions for the L4-Per interconnect
 - 26 regions for the L4-Emu interconnect

NOTE: Regions and segments are present for the L4-Wakeup interconnect but cannot be programmed. The L4-Wakeup protection is done through the L4-Core and L4-Emu interconnects.

A protection group is a group of targets that have the same protection settings. Initiator access is defined by `CONNID_BIT_VECTOR` field `L4_AP_PROT_GROUP_k_L[15:0]`. The initiators have the same access permission to all regions in this group.

A region is programmed to allow access to a unique selectable protection group by using `PROT_GROUP_ID` field `L4_AP_REGION_I_H[22:20]`.

NOTE: k denotes the protection group number.

l denotes the region number.

5.3.3.3.2 Protection Group

A protection group defines which initiators with a given MReqInfo can access the targets agent protected by this group.

The CONNID_BIT_VECTOR field L4_AP_PROT_GROUP_MEMBERS_k[15:0] (see Figure 5-15) is a 1-bit vector that sets up initiator permission access regions. A protection group is accessible by an initiator if the bit position corresponding to its ConnID is set to one in the CONNID_BIT_VECTOR field.

The ENABLE field L4_AP_PROT_GROUP_ROLES_k[31:0] lists all possible MReqInfo combinations. Setting a Req bit in this register determines the type of access allowed to the initiator. See Section 5.2.3.3.4, REQ_INFO_PERMISSION Configuration, for more information. MReqInfo is used in L4 the same way it is used in the L3 firewall configuration.

NOTE: Permissions are identical for read and write accesses in L4 interconnect targets.

Figure 5-15 shows an example of CONNID_BIT_VECTOR.

Figure 5-15. Example of CONNID_BIT_VECTOR

Setting bits 1 and 4 in the PROT_GROUP_ID_1 defines a group initiator able to access targets in protection group 1, and includes:

- MPU SS
- IVA2.2 MMU

Protection group 1 (PG1) can be applied to multiple protection regions without limitation. Each protection region l that is configured with PG1 enables permission access to these two initiators only.

The firewall default configuration for the L4-Core interconnect contains eight protection groups:

- Most regions are, by default, set with protection group 7 (PG7), which is configured for all access (see Table 5-113).
- Protection group 0 (PG0) is restricted to the MPU subsystem.

- The LCD is attached to protection group 2 (PG2).
- The Camera is attached to protection group 3 (PG3).
- By default, PG5 to PG7 are configured for all access.

The L4-Per interconnect contains eight protection groups:

- By default, PG0 to PG7 are configured for all access.
- By default, most regions are set with PG7, which is configured for all access (see [Table 5-114](#)).

The L4-Emu interconnect contains six protection groups:

- By default, most regions are set with PG5, which is configured for all access (see [Table 5-115](#)).
- The AP is attached to PG0.
- The emulation organs are attached to PG3.

5.3.3.3 Segments and Regions

The protection mechanism for L4 interconnects is based on a hierarchical segmentation (see [Figure 5-16](#)). By default, some regions are attached to a specific protection group. This specificity allows the user to set up the permission access for certain types of modules that require the same access protection without managing the region allocation.

Figure 5-16. L4 Firewall Overview

100-018

All interconnect address spaces are covered by regions. Table 5-113 to Table 5-115 list the module mapping, including the address, region number, and default protection group allocated to it.

By setting ENABLE bit L4_AP_REGION_y_H[0] to 0, the region becomes inactive and therefore inaccessible. Setting the bit to 1 activates the region.

Table 5-113. Region Allocation for L4-Core Interconnect

5.3.3.3.4 L4 Firewall Address and Protection Registers Setting

Table 5-116 lists the settings of the AP registers for an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

Table 5-116. L4 Firewall Register Description Overview

Register Type	Register Name	Bits	Field	Description
Segment	L4_AP_SEGMENT_i_L	23:0	Base	Segment base address
	L4_AP_SEGMENT_i_H	4:0	SIZE	Segment size equals to 2 power of SIZE
Protection groups	L4_AP_PROT_GROUP_MEMBERS_k_L	15:0	CONNID_BIT_VECTOR	See Section 5.3.3.1 for L4ConnID).
	L4_AP_PROT_GROUP_ROLES_k_L	15:0	ENABLE	Refer to Table 5-22 for MReq description

Table 5-116. L4 Firewall Register Description Overview (continued)

Register Type	Register Name	Bits	Field	Description
Region setting	L4_AP_REGION_I_L	23:0	BASE	Define the base address of region in respect to its respective segment base address
	L4_AP_REGION_I_H	27:24	SEGMENT_ID	Segment ID number of the region
		22:20	PROT_GROUP_ID	The protection group attached to the region
		19:17	BYTE_DATA_WIDTH_EX P	Determine the number of bytes in an access
		5:1	SIZE	Size of the region equals to 2 power of SIZE
	0	ENABLE	Enable the region protection	

5.3.3.4 Error Handling

5.3.3.4.1 Overview

The L4 interconnect provides mechanisms for handling either internally detected errors or errors reported by modules attached to the L4 target ports. Hardware support facilitates logging errors and cleaning up the state to allow error recovery software to treat the error.

As an L3 target, the L4 interconnect reports errors to the L3 interconnect in-band whenever possible. In-band error reporting is the default and recommended configuration. It is assumed that INBAND_ERROR_REP bit [L4_IA_AGENT_CONTROL_L\[27\]](#) is set to 1.

NOTE: *L4_IA* denotes which interconnect is considered: L4-Core, L4-Per, L4-Emu, or L4-Wakeup.
L4_TA denotes the module name, such as UART1, McBSP1, etc.

The L4 interconnects handle three types of errors:

- No target core found or address hole
- Request protection violation
- Failure of the target to service a request before a time-out expires

5.3.3.4.2 Error Logging

5.3.3.4.2.1 No Target Core Found/Address Hole

This error indicates that a request was addressed to a hole in the L4 address map.

When this occurs, an in-band error response is returned to the L3 level.

The error is also logged into the INBAND_ERROR bit [L4_IA_AGENT_STATUS_L\[27\]](#).

Additionally, an address hole error code is logged into the CODE field [L4_IA_ERROR_LOG_L\[25:24\]](#).

The L4_IA_ERROR_LOG register also includes MULTI bit [L4_IA_ERROR_LOG_L\[31\]](#), which is asserted when multiple errors are detected. In this case, the error code corresponds to the first error that occurs.

5.3.3.4.2.2 Protection Violation

This error indicates that an initiator has accessed a restricted region. This error is reported using an in-band error. It is written to the INBAND_ERROR field. A protection violation error code is also saved in the CODE field [L4_IA_ERROR_LOG_L\[25:24\]](#).

The protection violation is also logged in the CONTROL.CONTROL_PROT_ERR_STATUS [7] register of the system control module.

NOTE: There is no specific error signal for the protection violation that goes out from the L4 interconnects. The out-band error that goes to the system control module indicates a protection violation, but it also indicates normal interconnect errors.

5.3.3.4.2.3 Time-Out

This section gives information about all modules and features in the high-tier device. See [Section 1.5, OMAP35xx Family](#), to check availability of modules and features. To flag interconnect response being blocked, the time-out of target agents attached to unavailable modules can be enabled with the lowest setting.

A time-out mechanism can be enabled on a per-target basis in the [L4_TA_AGENT_CONTROL_L](#) register. If the mechanism is enabled for a TA, and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

The error is logged in the target agent REQ_TIMEOUT bit [L4_TA_AGENT_STATUS_L\[8\]](#). The affected TA enters an error state that causes it to send error responses to any new request targeted at it. To recover from this state, the TA must be reset by system software. The time-out is counted starting from the moment a command is presented to the target, regardless of how the target responds to the command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. These four signals are referred to as 1X-time base, 4X-time base, 16X-time base, and 64X-time base.

The time-base circuit offers four possible sets of time-base signals. Selection is done by programming TIMEOUT_BASE field [L4_LA_NETWORK_CONTROL_L\[10:8\]](#). [Table 5-117](#) lists the values in the number of L4 clock cycles.

Table 5-117. L4 Time-Out Link and TA Programming

TIMEOUT_BASE[2:0]	REQ_TIMEOUT[2:0]				
	0	1	2	3	4
0	All L4 time-out features are disabled.				
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16384
3		1024	4096	16384	65536
4		4096	16384	65536	262144

The reset value is 0x4, resulting in the longest possible time-out.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, by using REQ_TIMEOUT field [L4_TA_AGENT_CONTROL_L\[10:8\]](#) (see [Table 5-118](#)).

Table 5-118. L4 Time-Out TA Programming

REQ_TIMEOUT	Target Agent Time-Out Reference
0	Time-out locally disabled
1	1X-base cycle
2	4X-base cycle
3	16X-base cycle
4	64X-base cycle

A time-out condition is detected when the command acceptance or the response is not received after a delay of between one and three time-base periods.

Example:

- L4 frequency = 100 MHz
- TIMEOUT_BASE = 4 in the [L4_LA_NETWORK_CONTROL_L](#) register
- REQ_TIMEOUT = 2 in the [L4_TA_AGENT_CONTROL_L](#) for target agent A
- REQ_TIMEOUT = 4 in the [L4_TA_AGENT_CONTROL_L](#) for target agent B

At agent A, the time-base unit is 16384 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 164 μ s to 492 μ s.

At agent B, the time-base unit is 262,144 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 2.6 ms to 7.8 ms.

On detection of a time-out condition, the agent automatically generates an error response to the inter_IA, which is forwarded to the L3. The agent also logs the time-out to REQ_TIMEOUT bit [L4_TA_AGENT_STATUS_L\[8\]](#).

After the time-out has been detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, the software is assumed to reset first the faulty module by using its internal soft reset bit, and then the TA by using OCP_RESET bit [L4_TA_AGENT_CONTROL_L\[0\]](#).

5.3.3.4.3 TA Software Reset

Writing 1 to OCP_RESET bit [L4_TA_AGENT_CONTROL_L\[0\]](#) initiates the software reset period. The software reset must be asserted for at least 16 cycles of the target module OCP clock, which can be a divided clock with respect to the L4 clock.

During the software reset period the following occur:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to avoid getting unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The [L4_TA_AGENT_STATUS_L\[8\]](#) REQ_TIMEOUT status bit is cleared.

Writing 0 to the [L4_TA_AGENT_CONTROL_L\[0\]](#) OCP_RESET bit terminates the software reset period.

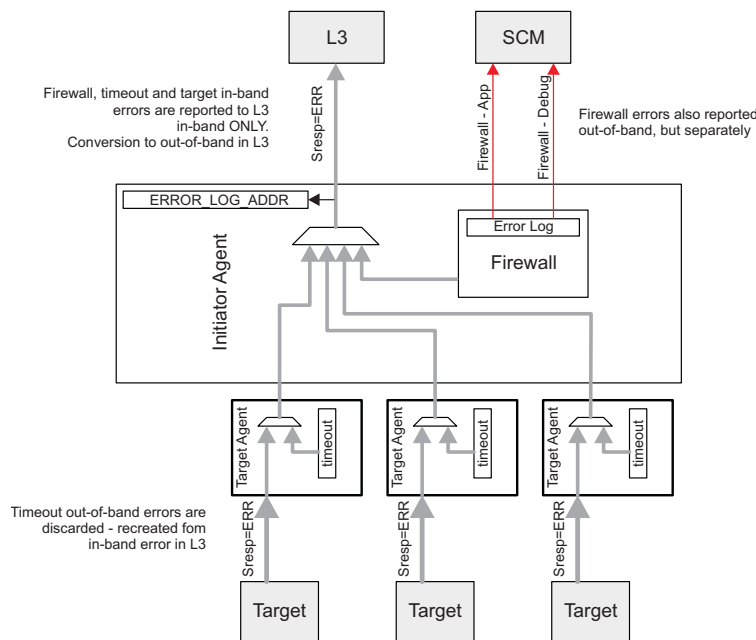

The attached module must then be reset to complete the recovery.

5.3.3.4.4 Error Reporting

[Figure 5-17](#) illustrates the error-reporting scheme used in the L4_Core, L4_Per, and L4_EMU interconnects.

- Timeout error generation is enabled at each TA.
- Timeout error and target in-band errors are only reported in-band to the L3 initiator.
- Protection violations are reported out-of-band. Error steering is used to distinguish between application or debug errors.

Figure 5-17. L4 Error Reporting

5.3.4 L4 Interconnect Programming Guide

5.3.4.1 L4 Interconnect Low-Level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L4 interconnect module.

5.3.4.1.1 Global Initialization

5.3.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the L4 interconnect module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the L4 interconnect. For more information, see , *L4 Interconnect Integration*.

Table 5-119. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For more information about the configuration of the module, see , <i>Power, Reset, and Clock Management</i> .
Control module	For more information about the configuration of the module, see , <i>Control Module</i> .
MPU INTC	The MPU INTC must be configured to enable the interrupts from the L4 interconnect module. See , <i>Interrupt Controllers</i> .
sDMA	For more information about the configuration of the sDMA, see , <i>sDMA</i> .
L3 interconnect	For more information about the interconnect configuration, see , <i>Interconnect</i> .

5.3.4.1.2 Operational Modes Configuration

5.3.4.1.2.1 L4 Interconnect Error Analysis Mode

5.3.4.1.2.1.1 Main Sequence: L4 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 5-18](#) and [Figure 5-19](#) show the software sequence required in most cases.

[Table 5-120](#) and [Table 5-121](#) show the main sequence for error analysis mode and its subprocess call summary, respectively.

Figure 5-18. Typical Error Analysis Sequence

icnt-026

Figure 5-19. Typical Error Analysis Sequence

Table 5-121. Subprocess Call Summary for Main Sequence – Error Analysis Mode

Subprocess	Cross-Reference
L3 interconnect error analysis	Section 5.2.3.4, Error Handling
L4 interconnect protection violation error identification	Section 5.3.4.1.2.1.2, Subsequence: L4 Interconnect Protection Violation Error Identification
L4 interconnect unsupported command/address hole error identification	Section 5.3.4.1.2.1.3, Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification
L4 interconnect reset TA and module	Section 5.3.4.1.2.1.4, Subsequence: L4 Interconnect Reset TA and Module

5.3.4.1.2.1.2 Subsequence: L4 Interconnect Protection Violation Error Identification

This procedure describes the protection violation error identification (see [Table 5-122](#)).

Table 5-122. Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	
Read error code.	L4_IA_ERROR_LOG_L[25:24] CODE	
IF: Is it an inband error?	L4_IA_AGENT_STATUS_L[27] INBAND_ERROR_REP	=0x1
Read status bits.	CONTROL.CONTROL_SEC_ERR_STATUS[17:16]	
Write 1 to clear status bits.	CONTROL.CONTROL_SEC_ERR_STATUS[17:16]	0x3
Write 1 to clear IA status bit.	L4_IA_AGENT_STATUS_L[27] INBAND_ERROR_REP	0x1
ELSE		
Read status bits.	CONTROL.CONTROL_PROT_ERR_STATUS_DE BUG[17:16]	
Write 1 to clear status bits.	CONTROL.CONTROL_PROT_ERR_STATUS_DE BUG[17:16]	0x3
ENDIF		
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear MError status.	L4_IA_AGENT_STATUS_L[24] MERROR_REP	0x1

5.3.4.1.2.1.3 Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification

This procedure describes the identification of unsupported command/address hole error (see [Table 5-123](#)).

Table 5-123. Unsupported Command/Address Hole Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	
Read initiator error code.	L4_IA_ERROR_LOG_L[25:24] CODE	
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear inband error status.	L4_IA_AGENT_STATUS_L[27] INBAND_ERROR_REP	0x1

5.3.4.1.2.1.4 Subsequence: L4 Interconnect Reset TA and Module

This procedure resets the TA and module (see [Table 5-124](#)).

Table 5-124. Reset TA and Module

Step	Register/Bit Field/Programming Model	Value
Reset TA.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x1
Wait until target module clock = 16 cycles.		
Write 0 to clear TA time - out status.	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	0x0
Write 0 to clear TA reset.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x0
Reset the attached module. ⁽¹⁾		

⁽¹⁾ For more information, see the respective module chapter.

5.3.4.1.2.2 L4 Interconnect Time-Out Configuration Mode

5.3.4.1.2.2.1 Main Sequence: L4 Interconnect Time-Out Configuration Mode

This procedure describes the time-out configuration sequence (see [Table 5-125](#)).

Table 5-125. Time-Out Configuration

Step	Register/Bit Field/Programming Model	Value
Disable time-out.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	0x0
Clear TA time-out error status. ⁽¹⁾	L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT	0x1
Set time-out at TA level. ⁽¹⁾	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	xxx
Set time-out base.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	xxx

⁽¹⁾ Must be done for each TA

5.3.4.1.2.3 L4 Interconnect Firewall Configuration Mode

5.3.4.1.2.3.1 Main Sequence: L4 Interconnect Firewall Configuration Mode

This procedure describes the firewall configuration sequence (see [Table 5-126](#)).

Table 5-126. Firewall Configuration

Step	Register/Bit Field/Programming Model	Value
Define the members of protection group k. ⁽¹⁾	L4_AP_PROT_GROUP_MEMBERS_k_L[15:0] CONNID_BIT_VECTOR	xxx
Define the access type of a protection group k. ⁽¹⁾	L4_AP_PROT_GROUP_ROLES_k_L[15:0] ENABLE	xx
Set region affiliation to protection group. ⁽²⁾	L4_AP_REGION_I_L[22:20] PROT_GROUP_ID	xxx

⁽¹⁾ Must be done for each protection group

⁽²⁾ Must be done for each region

5.3.5 L4 Interconnects Register Manual

A summary of the hardware interface for the L4-Core, L4-Per, L4-Emu, and L4-Wkup interconnects is given in [Table 5-127](#) through [Table 5-130](#), respectively. Each module instance in the design is shown with the module register map and bit definitions for each bit field.

5.3.5.1 L4 Initiator Agent (L4 IA)

This section provides information on the L4 IA module. Each of the registers within the module instance is described separately in [Table 5-131](#) to [Table 5-132](#).

The initiator OCP interface register block (IA) consists of the status, control, and error log registers that can be used to configure the interface of an initiator OCP. There can be only one register block for each initiator OCP interface.

Table 5-131. L4 IA Register Summary (1)

Register Name	Type	Register Width (Bits)	CORE_IA Physical Address	PER_IA Physical Address	EMU_IA_L3 Physical Address

L4 Interconnects

- [L4 Initiator Agent \(L4 IA\): \[0\] \[1\]](#)

Table 5-141. L4_IA_AGENT_CONTROL_L

Address Offset	0x020
Physical Address	See Table 5-131 to Table 5-132
Description	Enable error reporting on an initiator interface. The error reporting mechanism is enabled when the INBAND_ERROR_REP bit field is set to 1. The out-of-band OCP MError reporting mechanism is enabled when the MERROR_REP bit field is set to 1.
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved				INBAND_ERROR_REP	Reserved		MERROR_REP	Reserved																							

Bits	Field Name	Description	Type	Reset
31:28	Reserved	Read returns 0.	R	0x0
27	INBAND_ERROR_REP	Setting this field to 1 reports on in-band errors using the INBAND_ERROR log bit of IA.AGENT_STATUS register.	R	1
26:25	Reserved	Read returns 0.	R	0x0
24	MERROR_REP	Enable MError reporting	R	0x0
23:0	Reserved	Read returns 0.	R	0x0000000

Table 5-149. L4_IA_ERROR_LOG_L

Address Offset	0x058
Physical Address	See Table 5-131 to Table 5-132
Description	Log information about error conditions. The CODE field logs any protection violation or address hole errors detected by the initiator subsystem while decoding a request.
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MULTI		Reserved				CODE		Reserved																							

Bits	Field Name	Description	Type	Reset
31	MULTI	While the CODE field is not zero, the MULTI bit is asserted whenever an additional error is detected. Once set by hardware, the MULTI bit can only be cleared by writing a 1 to it while writing a value other than zero to the CODE field.	RW	0
30:26	Reserved	Read returns 0.	R	0x00
25:24	CODE	The error code of an initiator request. 0x00: No errors 0x01: Reserved 0x10: Address hole 0x11: Protection violation The CODE field, once set by hardware, can only be cleared by writing a non-zero value to it, in conjunction with writing a 1 to the MULTI bit field.	RW	0x0
23:0	Reserved	Read returns 0.	R	0x000000

5.3.5.2 L4 Target Agent (L4 TA)

This section provides information on the L4 Target agent (TA) register module. Each of the registers within the module instance is described separately in [Table 5-153](#) to [Table 5-176](#).

[Table 5-153](#) to [Table 5-177](#) provide information on the L4 Target Agent having two supplementary registers OCP_CONTROL and OCP_STATUS

The TA register block consists of the status and control registers that can be used to configure the interfaces of the targets.

Table 5-186. L4_TA_AGENT_CONTROL_L

Address Offset	0x020
Physical Address	See Table 5-153 to Table 5-177
Description	Enable error reporting
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved								SERROR_REP	Reserved												REQ_TIMEOUT	Reserved								OCP_RESET	

Bits	Field Name	Description	Type	Reset
31:25	Reserved	Read returns 0.	R	0x00
24	SERROR_REP	Enable logging of error	R	0x0
23:11	Reserved	Read returns 0.		
10:8	REQ_TIMEOUT	Timeout Bound. Values are:0 - No timeout 1 - 1x base cycles 2 - 4x base cycles 3 - 16x base cycles 4 - 64x base cycles	RW	0x2
7:1	Reserved	Read returns 0.	R	0x00
0	OCP_RESET	The OCP_RESET field controls the OCP reset signal to the attached core. Setting this bit clears any pending transfers and resets the OCP interface. The bit must be cleared to de-assert the OCP reset signal. When the software reset feature is available on a target agent, the target agent OCP must also have a reset signal directed to the target core.	RW	0

5.3.5.3 L4 Link Register Agent (LA)

This section provides information on the L4-Core link agent (LA) register module. Each of the registers within the module instance is described separately in [Table 5-194](#).

The LA register block contains the initiator subsystem information register and the composite sideband signal mask and status registers.

Table 5-211. L4_LA_NETWORK_CONTROL_H

Address Offset	0x024
Physical Address	Please refer to Table 5-194
Description	Control interconnect global power control
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved								CLOCK_GATE_DISABLE	Reserved				THREAD0_PRI	Reserved								EXT_CLOCK	Reserved								

Bits	Field Name	Description	Type	Reset
31:25	Reserved	Read returns 0.	R	0x00
24	CLOCK_GATE_DISABLE	When set to 1 this field disables all clock gating.	RW	0

Bits	Field Name	Description	Type	Reset
23:21	Reserved	Read returns 0.	R	0x0
20	THREAD0_PRI	Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads.	R	1
19:9	Reserved	Read returns 0.	R	0x000
8	EXT_CLOCK	When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off.	R	1
7:0	Reserved	Read returns 0.	R	0x00

Interprocessor Communication

This chapter describes the interprocessor communication (IPC) module.

NOTE: Some features may not be available or supported in your particular device. For more information, see Chapter 1, the Device Family section, and your device-specific data manual.

Topic	Page
6.1 IPC Overview	734
6.2 IPC Integration	734
6.3 IPC Mailbox Functional Description	738
6.4 IPC Mailbox Basic Programming Model	741
6.5 IPC Mailbox Use Cases and Tips	745
6.6 IPC Mailbox Register Manual	751

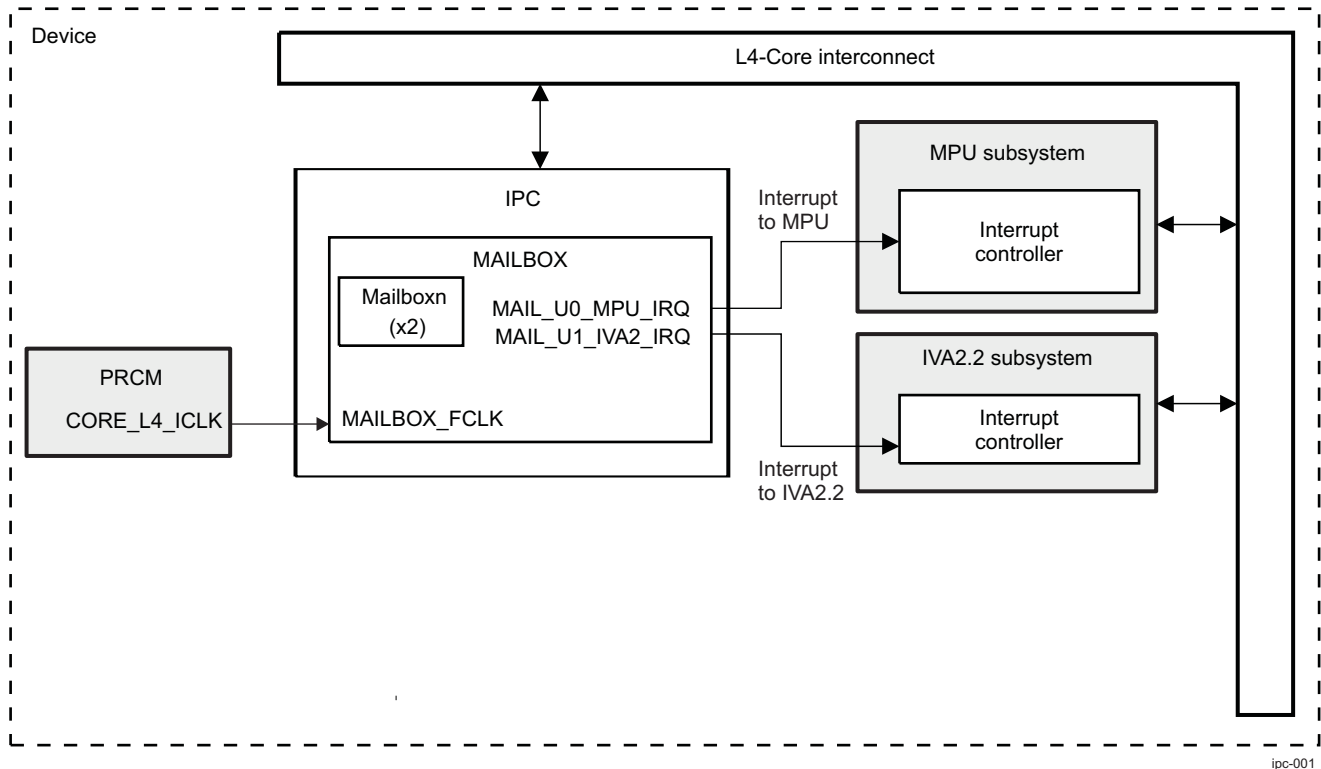

6.1 IPC Overview

Communication between the on-chip processors of the device uses a queued mailbox-interrupt mechanism.

The queued mailbox-interrupt mechanism allows the software to establish a communication channel between two processors through a set of registers and associated interrupt signals by sending and receiving messages (mailboxes).

Figure 6-1 shows a block diagram of the interprocessor communication (IPC) module.

Figure 6-1. Simplified Block Diagram of the IPC

The mailbox module includes these features:

- Two mailbox message queues for microprocessor unit (MPU) and imaging video and audio accelerator (IVA2.2) communications.
- Flexible assignment of receiver and sender for each mailbox through interrupt configuration
- 32-bit message width
- Four-message FIFO depth for each message queue
- Message reception and queue-not-full notification using interrupts
- Support of 16-/32-bit addressing scheme
- Power management support
- Automatic idle mode for power savings

6.2 IPC Integration

Figure 6-2 highlights the IPC integration in the device.

Figure 6-2. IPC Integration

ipc-002

6.2.1 Clocking, Reset, and Power-Management Scheme

6.2.1.1 Clocks

6.2.1.1.1 Module Clocks

The mailbox module receives one input clock, CORE_L4_ICLK, from the power, reset, and clock management (PRCM) module. CORE_L4_ICLK is gated internally and can be turned off to lower operating power when a module is not active. The exact frequency of this clock depends on PRCM programming.

6.2.1.2 Resets

The IPC supports both a hardware reset and a software reset.

6.2.1.2.1 Hardware Reset

The mailbox module receives its reset signal, CORE_RST (the reset signal of the CORE power domain), from the PRCM module.

6.2.1.2.2 Software Reset

The mailbox module supports a software reset by accessing the MAILBOX.MAILBOX_SYSCONFIG[1] SOFTRESET bit (0: normal mode, 1: module is reset).

6.2.1.3 Power Domains

The mailbox module connects to the CORE power domain.

6.2.1.4 Power Management

6.2.1.4.1 System Power Management

This section describes system power management for the mailbox module.

As part of the system-wide power-management scheme, the mailbox module supports a communication protocol with the PRCM that allows the PRCM to request the mailbox to enter a low-power state. When the mailbox module acknowledges a low-power-mode request from the PRCM, the clock to the module is gated off at the PRCM clock generator. Because the clock is disabled at the source, the low-power mode offers lower power consumption than the internal clock-gating method in the local power management.

The PRCM.CM_ICLKEN1_CORE[7] EN_MAILBOXES bit in the PRCM module controls the mailbox clock. When this bit is 1, the clock to the mailbox module is enabled; otherwise, the clock is disabled (see [Chapter 4, Power, Reset, and Clock Management](#), for more information).

The mailbox module can be configured using the MAILBOX.MAILBOX_SYSCONFIG[4:3] SIDLEMODE field to one of the following acknowledgment modes:

- No-idle mode: The mailbox module never enters the idle state.
- Force-idle mode: The mailbox module immediately enters the idle state on receiving a low-power-mode request from the PRCM module. In this mode, the software must ensure that there are no asserted output interrupts before requesting this mode to go into the idle state.
- Smart-idle mode: After receiving a low-power-mode request from the PRCM module, the mailbox module enters the idle state only after all asserted output interrupts are acknowledged.

[Table 6-1](#) describes the mailbox power-management modes.

Table 6-1. Mailbox Power Management Modes

Power-Management Mode Requested by the PRCM	MAILBOX.MAILBOX_SYSCONFIG[4:3] SIDLEMODE Bit Field (Offset: 0x010)
Force-idle	00
No-idle	01
Smart-idle	10
Reserved (not used)	11

NOTE: The mailbox idle status can be read from the PRCM.CM_IDLEST1_CORE[7] ST_MAILBOXES bit. When this bit is 0, the mailbox module cannot be accessed; otherwise, the mailbox module can be accessed (see [Chapter 4, Power, Reset, and Clock Management](#), for more information).

6.2.1.4.2 Module Power Management

This section describes local power management for the mailbox module.

To conserve power, the mailbox module supports an automatic idle mode whenever no activity is detected on the mailbox L4-Core interconnect interface. The automatic idle mode is enabled or disabled through the MAILBOX.MAILBOX_SYSCONFIG[0] AUTOIDLE bit.

When the MAILBOX.MAILBOX_SYSCONFIG[0] AUTOIDLE bit is asserted, the automatic idle mode is enabled in cases in which no activity is detected on the L4-Core interconnect interface, and the mailbox clock is disabled internally to the module, thus reducing power consumption.

When new activity is detected on the L4-Core interconnect interface, the clock is restarted with no latency penalty. After reset, the automatic idle mode is disabled; therefore, it is recommended that software enable the automatic idle mode for reduced power consumption.

NOTE: The PRCM.CM_AUTOIDLE1_CORE[7] AUTO_MAILBOXES bit controls whether the mailbox interface clock is enabled or disabled in synchronization with the CORE power domain state transition (see [Chapter 4, Power, Reset, and Clock Management](#), for more information).

6.2.2 Hardware Requests

6.2.2.1 Interrupt Requests

The mailbox module can generate two interrupts:

- MAIL_U0_MPU_IRQ, mapped on M_IRQ_26 of the MPU subsystem interrupt controller
- MAIL_U1_IVA2_IRQ, mapped on IVA2_IRQ[10] of the IVA2.2 subsystem interrupt controller

Each interrupt allows the user (MPU subsystem or IVA2.2 subsystem) of the mailbox to be notified when a message is received or when the message queue is not full. There is one interrupt per user.

6.2.2.2 Idle Handshake Protocol

The PRCM module handles an idle handshake protocol for the mailbox module. The PRCM requires the mailbox module to enter idle mode. The mailbox module acknowledges when it is ready.

6.3 IPC Mailbox Functional Description

NOTE: In the mailbox functional description, *u* is the user number from 0 to 1 and *m* is the mailbox number from 0 to 1.

The mailbox module provides a means of communication through message queues among the MPU and the IVA2.2. The two individual mailbox modules, or FIFOs, can associate with any of the processors using the MAILBOX.MAILBOX_IRQENABLE_u registers.

The mailbox module includes the following two user subsystems:

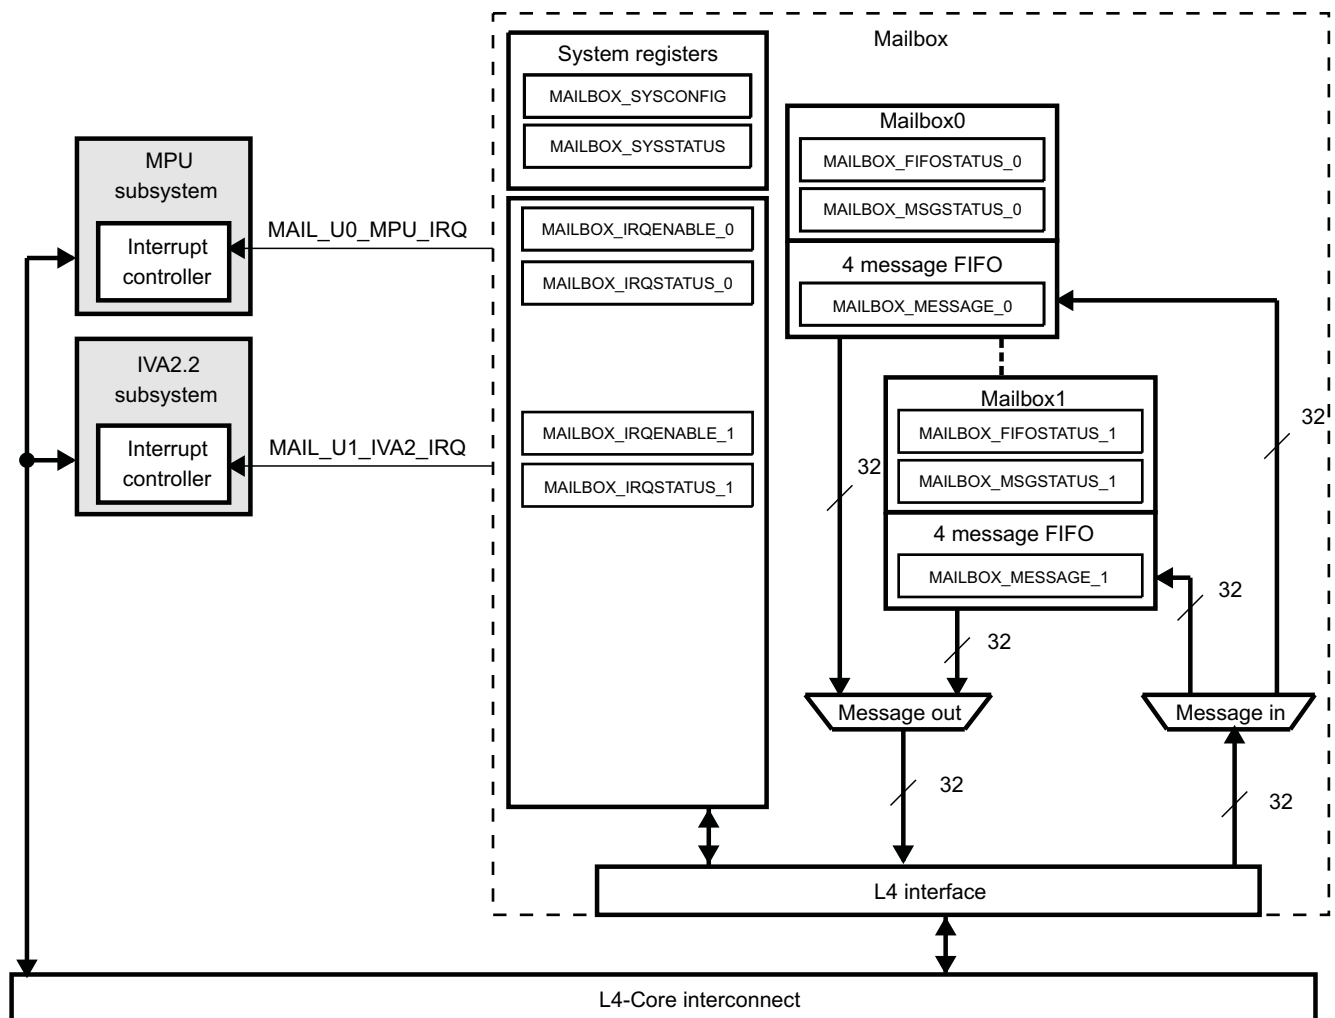

- User 0: MPU subsystem (u = 0)
- User 1: IVA2.2 subsystem (u = 1)

Each user has a dedicated interrupt signal from the mailbox module and a dedicated pair of interrupt enabling and status registers. Each MAILBOX.MAILBOX_IRQSTATUS_u interrupt status register corresponds to a particular user. A user can query its interrupt status register through the L4-Core interconnect.

6.3.1 Block Diagram

Figure 6-3 shows the mailbox block diagram.

Figure 6-3. Mailbox Block Diagram

ipc-003

6.3.2 Mailbox Assignment

6.3.2.1 Description

To assign a receiver to a mailbox, set the new message interrupt enable bit corresponding to the desired mailbox in the MAILBOX.MAILBOX_IRQENABLE_u register. The receiver reads the MAILBOX.MAILBOX_MESSAGE_m register to retrieve a message from the mailbox.

An alternate method for the receiver that does not use the interrupts is to poll the MAILBOX.MAILBOX_FIFOSTATUS_m and/or MAILBOX.MAILBOX_MSGSTATUS_m registers to know when to send or retrieve a message to or from the mailbox. This method does not require assigning a receiver to a mailbox. Because this method does not include the explicit assignment of the mailbox, the software must avoid having multiple receivers use the same mailbox, which can result in incoherency.

To assign a sender to a mailbox, set the queue-not-full interrupt enable bit of the desired mailbox in the MAILBOX.MAILBOX_IRQENABLE_u register, where *u* is the number of the receiving user. However, direct allocation of a mailbox to a sender is not recommended because it can cause the sending processor to be constantly interrupted.

It is recommended that register polling be used to:

- Check the status of either the MAILBOX.MAILBOX_FIFOSTATUS_m or MAILBOX.MAILBOX_MSGSTATUS_m registers
- Write the message to the corresponding MAILBOX.MAILBOX_MESSAGE_m register, if space is available.

The sender should use the queue-not-full interrupt when the initial mailbox status check indicates the mailbox is full. In this case, the sender can enable the queue-not-full interrupt for its mailbox in the appropriate MAILBOX.MAILBOX_IRQENABLE_u register. This allows the sender to be notified by interrupt only when a FIFO queue has at least one available entry.

Reading the MAILBOX.MAILBOX_IRQSTATUS_u register determines the status of the new message and the queue-not-full interrupts for a particular user. Writing 1 to the corresponding bit in the same register location acknowledges, and subsequently clears, an interrupt.

CAUTION

Assigning multiple senders or multiple receivers to the same mailbox is not recommended.

6.3.3 Sending and Receiving Messages

6.3.3.1 Description

When a 32-bit message is written to the MAILBOX.MAILBOX_MESSAGE_m register, the message is appended into the FIFO queue. This queue holds four messages. If the queue is full, the message is discarded.

Queue overflow can be avoided by first reading the MAILBOX.MAILBOX_FIFOSTATUS_m register to check that the mailbox message queue is not full before writing a new message to it.

Reading the MAILBOX.MAILBOX_MESSAGE_m register returns the message at the beginning of the FIFO queue and removes it from the queue. If the FIFO queue is empty when the MAILBOX.MAILBOX_MESSAGE_m register is read, the value 0 is returned.

The new message interrupt is asserted when at least one message is in the mailbox message FIFO queue. To determine the number of messages in the mailbox message FIFO queue, read the MAILBOX.MAILBOX_MSGSTATUS_m register.

6.3.4 16-Bit Register Access

6.3.4.1 Description

So that 16-bit processors can access the mailbox module, the device allows 16-bit register read and write access, with restrictions for the MAILBOX.MAILBOX_MESSAGE_m registers. The 16-bit half-words are organized in little endian fashion; that is, the least-significant 16 bits are at the low address and the most-significant 16 bits are at the high address (low address + 0x02).

All mailbox module registers can be read or written to directly using individual 16-bit accesses with no restriction on interleaving, except the MAILBOX.MAILBOX_MESSAGE_m registers, which must always be accessed by either single 32-bit accesses or two consecutive 16-bit accesses.

CAUTION

When using 16-bit accesses, it is critical to ensure that the mailbox used has only one assigned receiver and only one assigned sender.

When using 16-bit accesses to the MAILBOX.MAILBOX_MESSAGE_m registers, the order of access must be the least-significant half-word first (low address) and the most-significant half-word last (high address). This requirement is due to the update operation by the message FIFO of the MAILBOX.MAILBOX_MSGSTATUS_m registers. The update of the FIFO queue contents and the associated status registers and possible interrupt generation occurs only when the most-significant 16 bits of a MAILBOX.MAILBOX_MESSAGE_m are accessed.

6.4 IPC Mailbox Basic Programming Model

6.4.1 Initialization Flow for the Mailbox Module

The initialization flow for the mailbox module consists of the following steps:

1. Perform a software reset of the mailbox module (see [Section 6.4.1.1, Software Reset](#)).
2. Set the idle mode and clock configuration of the mailbox module (see [Section 6.4.1.2, Idle Mode and Clock Configuration](#)).

6.4.1.1 Software Reset

To perform a software reset, write 1 in the MAILBOX.MAILBOX_SYSCONFIG[1] SOFTRESET bit. The MAILBOX.MAILBOX_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1.

When the software reset completes, the MAILBOX.MAILBOX_SYSCONFIG[1] SOFTRESET bit is automatically reset. The software must ensure that the software reset completes before doing mailbox operations.

CAUTION

When performing a software reset by writing 1 in the MAILBOX.MAILBOX_SYSCONFIG[1] SOFTRESET bit, 0 must be written in the other bits of the MAILBOX.MAILBOX_SYSCONFIG register.

6.4.1.2 Idle Mode and Clock Configuration

The idle mode and clock configuration is done by setting the MAILBOX.MAILBOX_SYSCONFIG[4:3] SIDLEMODE field and the MAILBOX.MAILBOX_SYSCONFIG[0] AUTOIDLE bit (see [Section 6.6, Mailbox Register Manual](#), for more information).

6.4.2 Mailbox Assignment

Before communicating, mailboxes can be explicitly assigned to a user using the appropriate MAILBOX.MAILBOX_IRQENABLE_u register. The software must ensure that only one sender and one receiver are assigned per mailbox.

For example, to assign mailbox 1 ($m = 1$) to the MPU ($u = 0$, see [Section 6.3, Mailbox Functional Description](#), for the user number) as a receiver, set the MAILBOX.MAILBOX_IRQENABLE_0[2] NEWMSGENABLEUUMB1 bit to generate an interrupt to the MPU when a new message is received in mailbox 1.

To assign mailbox 0 ($m = 0$) to the MPU ($u = 0$) as a sender, set the MAILBOX.MAILBOX_IRQENABLE_0[1] NOTFULLENABLEUUMB0 bit to generate an interrupt to the MPU when the message queue of mailbox 0 is not full.

6.4.3 Mailbox Communication Preparation

Before communicating with another user, the sender must first use one of the following methods to determine that the mailbox message FIFO queue is not full:

- Poll the MAILBOX.MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB bit or the MAILBOX.MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB field to determine if there is an open slot available to write a message.
- If the queue-not-full interrupt is enabled by setting the corresponding bit in the MAILBOX.MAILBOX_IRQENABLE_u register, an interrupt to the sender indicates that the mailbox has an available slot. To avoid continuous interrupt to the sender, it is recommended that the software waits until the message queue is full by reading the MAILBOX.MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB field before enabling the interrupt in the MAILBOX.MAILBOX_IRQENABLE_u register. When a queue-not-full interrupt is generated to the sender, the interrupt should be disabled until the

message queue is full for the same reason.

The receiver can also detect new messages from another user using two methods:

- Poll the MAILBOX.MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB bit or the MAILBOX.MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB field.
- Use a new message ISR (interrupt service routine). In this case, the receiver must enable the appropriate interrupt in the MAILBOX.MAILBOX_IRQENABLE_u register.

NOTE: After an interrupt is generated, and before exiting the ISR, write 1 in each bit responsible for this generation in the MAILBOX.MAILBOX_IRQSTATUS_u register, thereby clearing these bits.

6.4.4 Mailbox Communication Sequence

When a message slot is available in the mailbox, a message can be transmitted by a sender to a receiver using the following steps:

1. The sender writes a message in the MAILBOX.MAILBOX_MESSAGE_m register. This results in the following actions:
 - The message is stored at the tail of the FIFO queue of mailbox *m*, and the MAILBOX.MAILBOX_FIFOSTATUS_m and MAILBOX.MAILBOX_MSGSTATUS_m registers are updated.
 - If the FIFO queue was previously empty, a new message interrupt can be generated to the receiver to which the mailbox is allocated; otherwise, the interrupt is already asserted and remains so.
2. The receiver can either use an ISR or poll the MAILBOX.MAILBOX_FIFOSTATUS_m or MAILBOX.MAILBOX_MSGSTATUS_m registers to detect new messages and read them by accessing the MAILBOX.MAILBOX_MESSAGE_m register.
 - If using interrupts, the receiver enters the ISR when it detects the new message interrupt. The receiver checks both the MAILBOX.MAILBOX_IRQSTATUS_u register to determine the source of the interrupt and the MAILBOX.MAILBOX_MSGSTATUS_m register(s) to determine the number of messages in the FIFO queue.
 - The receiver can poll the appropriate MAILBOX.MAILBOX_MSGSTATUS_m register(s) to check the status and determine if there are any pending messages to read. The receiver can read the MAILBOX.MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB field to determine how many messages are available.
3. Using either ISR or polling method, when the receiver determines that it has a message pending in a mailbox, it repeatedly reads the MAILBOX.MAILBOX_MESSAGE_m register to remove all messages from the FIFO queue until a read in the MAILBOX.MAILBOX_MSGSTATUS_m register indicates no more messages are available (MAILBOX.MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB field = 0x00).
4. After reading all of the messages, the receiver can acknowledge the new message interrupt by writing 1 in the appropriate bit of the MAILBOX.MAILBOX_IRQSTATUS_u register to clear the interrupt flag before exiting the ISR.

6.4.5 Example of Communication

This example shows how communication is established between the MPU and IVA2.2 subsystems in the device. The MPU subsystem sends messages to the IVA2.2 subsystem through mailbox 0, and the IVA2.2 subsystem sends messages to the MPU subsystem through mailbox 1.

To establish communication, the software follows these steps:

1. Turn on the automatic idle feature by writing 1 in the MAILBOX.MAILBOX_SYSCONFIG[0] AUTOIDLE bit.
2. Configure the mailbox in smart-idle mode by setting the MAILBOX.MAILBOX_SYSCONFIG[4:3] SIDLEMODE field in smart-idle mode (smart-idle is the recommended mode; see [Section 6.6, Mailbox Register Manual](#), for more information). Smart-idle mode allows the PRCM low-power-mode requests to be acknowledged only after clearing any pending interrupts.

3. Write 1 in the MAILBOX.MAILBOX_IRQENABLE_1[0] NEWMSGENABLEUUMB0 bit to enable interrupts to the IVA2.2 subsystem when a new message is received in mailbox 0.
4. Write 1 in the MAILBOX.MAILBOX_IRQENABLE_0[2] NEWMSGENABLEUUMB1 bit to enable interrupts to the MPU subsystem when a new message is received in mailbox 1.
5. Enable interrupts in the corresponding subsystems.

6.4.5.1 Sending a Message (Polling Method)

To send a message using the polling method, the MPU or IVA2.2 subsystem follows these steps:

1. The MPU subsystem (or IVA2.2 subsystem) determines if the message queue of mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is full by reading the MAILBOX.MAILBOX_FIFOSTATUS_0[0] FIFOFULLMB bit (or the MAILBOX.MAILBOX_FIFOSTATUS_1[0] FIFOFULLMB bit for the IVA2.2 subsystem).
2. If the MAILBOX.MAILBOX_FIFOSTATUS_0[0] FIFOFULLMB bit (or the MAILBOX.MAILBOX_FIFOSTATUS_1[0] FIFOFULLMB bit for the IVA2.2 subsystem) is 0, mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) has a message slot available to store a new message; go to step 4.
3. If the MAILBOX.MAILBOX_FIFOSTATUS_0[0] FIFOFULLMB bit (or the MAILBOX.MAILBOX_FIFOSTATUS_1[0] FIFOFULLMB bit for the IVA2.2 subsystem) is 1, mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is full; go back to step 1.
4. The MPU subsystem (or IVA2.2 subsystem) can send a message by writing it into the MAILBOX.MAILBOX_MESSAGE_0 register (or the MAILBOX.MAILBOX_MESSAGE_1 register for the IVA2.2 subsystem).

6.4.5.2 Sending a Message (Interrupt Method)

To send a message using the interrupt method, the MPU or IVA2.2 subsystem follows these steps:

1. To avoid continuous interruption, the MPU subsystem (or the IVA2.2 subsystem) must determine if mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is full by reading the MAILBOX.MAILBOX_FIFOSTATUS_0[0] FIFOFULLMB bit (or the MAILBOX.MAILBOX_FIFOSTATUS_1[0] FIFOFULLMB bit for the IVA2.2 subsystem).
2. If mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is full, the MPU subsystem (or the IVA2.2 subsystem) can enable the queue-not-full interrupt by setting the MAILBOX.MAILBOX_IRQENABLE_0[1] NOTFULLENABLEUUMB0 bit (or the MAILBOX.MAILBOX_IRQENABLE_1[3] NOTFULLENABLEUUMB1 bit for the IVA2.2 subsystem), and perform another task before an interrupt occurs; go to step 4).
3. If mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is not full, the MPU can go back to step 1 and wait for mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) to fill, or the MPU can send a message, if necessary, by writing in the MAILBOX.MAILBOX_MESSAGE_0 register (or the MAILBOX.MAILBOX_MESSAGE_1 register for the IVA2.2 subsystem).
4. After receiving an interrupt, the MPU subsystem (or the IVA2.2 subsystem) enters the ISR and reads the MAILBOX.MAILBOX_IRQSTATUS_0[1] NOTFULLSTATUSUUMB0 bit (or the MAILBOX.MAILBOX_IRQSTATUS_1[3] NOTFULLSTATUSUUMB1 bit for the IVA2.2 subsystem) to determine if mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is not full and thus send its message. The MPU subsystem writes the message in the MAILBOX.MAILBOX_MESSAGE_0 register (or the MAILBOX.MAILBOX_MESSAGE_1 register for the IVA2.2 subsystem). The MPU subsystem (or the IVA2.2 subsystem) then acknowledges the interrupt by writing 1 in the MAILBOX.MAILBOX_IRQSTATUS_0[1] NOTFULLSTATUSUUMB0 bit (or the MAILBOX.MAILBOX_IRQSTATUS_1[3] NOTFULLSTATUSUUMB1 bit for the IVA2.2 subsystem).

NOTE: To send several messages, a subsystem or processor must determine if the message queue of mailbox *m* has enough available slots by checking the MAILBOX.MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB bit field before writing all of the messages in this mailbox (see [Section 6.6, Mailbox Register Manual](#), for more information).

6.4.5.3 Receiving Messages (Interrupt Method)

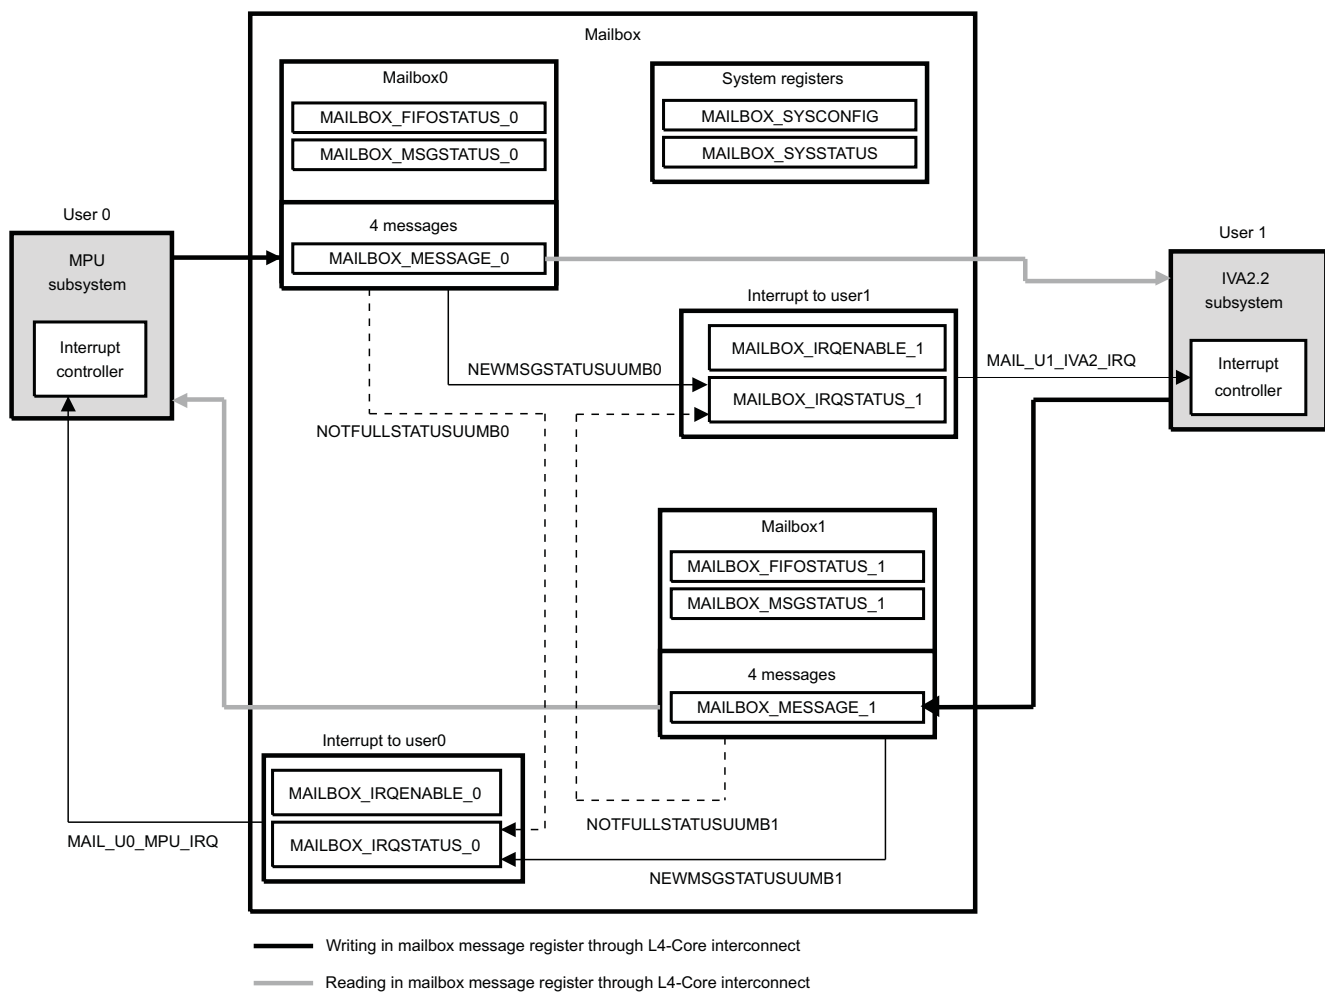

After receiving an interrupt indicating that a new message is received, the MPU or IVA2.2 subsystem follows these steps:

1. The MPU subsystem (or the IVA2.2 subsystem) determines how many messages are stored in the message queue of mailbox 1 by reading the MAILBOX.MAILBOX_MSGSTATUS_1[2:0] NBOFMSGMB field (or the MAILBOX.MAILBOX_MSGSTATUS_0[2:0] NBOFMSGMB bit field for the IVA2.2 subsystem).
2. The MPU subsystem (or the IVA2.2 subsystem) reads the MAILBOX.MAILBOX_MESSAGE_1 register (or the MAILBOX.MAILBOX_MESSAGE_0 register for the IVA2.2 subsystem) as many times as there are messages in mailbox 1 (or mailbox 0 for the IVA2.2 subsystem).
3. Finally, the MPU subsystem (or the IVA2.2 subsystem) acknowledges the interrupt by writing 1 in the MAILBOX.MAILBOX_IRQSTATUS_0[2] NEWMSGSTATUSUUMB1 bit (or the MAILBOX.MAILBOX_IRQSTATUS_1[0] NEWMSGSTATUSUUMB0 bit for the IVA2.2 subsystem).

NOTE: After the interrupt is acknowledged, if the mailbox message queue is not empty, the interrupt is reasserted.

Figure 6-4 shows an example of communication:

Figure 6-4. Example of Communication

ipc-004

6.5 IPC Mailbox Use Cases and Tips

6.5.1 Camcorder Use Case: How to Configure the Mailbox Module for Communication Between the MPU and the IVA2.2 Subsystems

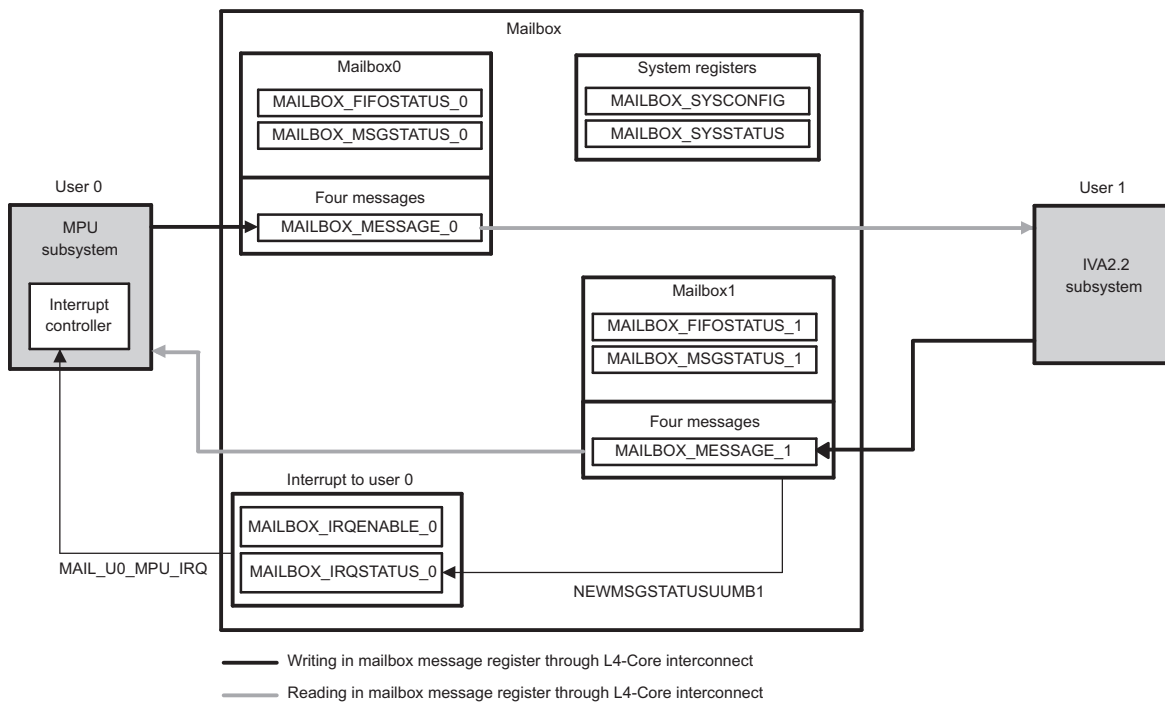

6.5.1.1 Overview

In a whole Camcorder use case, the mailbox module is in charge of the communication between the MPU and the IVA2.2 subsystems in the device.

The MPU subsystem send messages to the IVA2.2 subsystem through mailbox 0: typically, an audio or video compression request (a command and a memory address). And the IVA2.2 subsystem sends messages to the MPU subsystem through mailbox 1: typically, a compression completion message with error management.

Figure 6-5 shows an overview of the use of the mailbox module in the case of the Camcorder use case.

Figure 6-5. Overview

For the Camcorder use case, the configuration is the following:

- 32-bit message width
- Use of polling method for MPU subsystem message sending (mailbox 0), IVA2.2 subsystem message receiving (mailbox 0), and IVA2.2 subsystem message sending (mailbox 1)
- Use of interrupt method for MPU subsystem message receiving (mailbox 1)
- NewMessage interrupt to the MPU subsystem indicating a new message is received on mailbox 1

6.5.1.2 Programming Flow

6.5.1.2.1 Initial Configuration

The initialization of the mailbox module is done in two parts:

1. Mailbox module initialization
2. Interrupt enabling

The following two subsections describe these initialization parts.

See [Figure 6-6](#) for the corresponding programming flow chart.

6.5.1.2.1.1 Mailbox Module Initialization

To initialize the mailbox module, the following steps must be done:

1. Enable the clock for the mailbox module (set the PRCM.CM_ICLKEN1_CORE[7] EN_MAILBOXES bit to 1)
2. Set the MAILBOX.MAILBOX_SYSCONFIG[1] SOFTRESET bit to 1. This bit is automatically reset by the hardware
3. Poll the MAILBOX.MAILBOX_SYSSTATUS[0] RESETDONE bit until it is set to 1 by the mailbox module to indicate that the mailbox module is complete

[Table 6-2](#) shows all the registers to be configured for the mailbox module initialization.

Table 6-2. Register Print After the Mailbox Module Initialization

Register Name	Physical Address	Value	Value Description
PRCM.CM_ICLKEN1_CORE	0x4800 4A10	0x0000 0080	EN_MAILBOXES bit set to 1 to enable the mailbox clock
MAILBOX.MAILBOX_SYSCONFIG	0x4809 4010	0x0000 0002	SOFTRESET bit set to 1 to reset the mailbox module
MAILBOX.MAILBOX_SYSSTATUS	0x4809 4014	0x0000 0001	The RESETDONE bit is set to 1 by the mailbox module when the software reset is complete

6.5.1.2.1.2 Interrupt Enabling

The NewMessage interrupt is asserted when at least one message is in the mailbox message FIFO queue.

To generate an interrupt to the MPU subsystem when a new message is received on mailbox 1, set the MAILBOX.MAILBOX_IRQENABLE_0[2] NEWMSGENABLEUUMB1 bit to 1.

[Table 6-3](#) shows all the registers to be configured for the interrupt enabling.

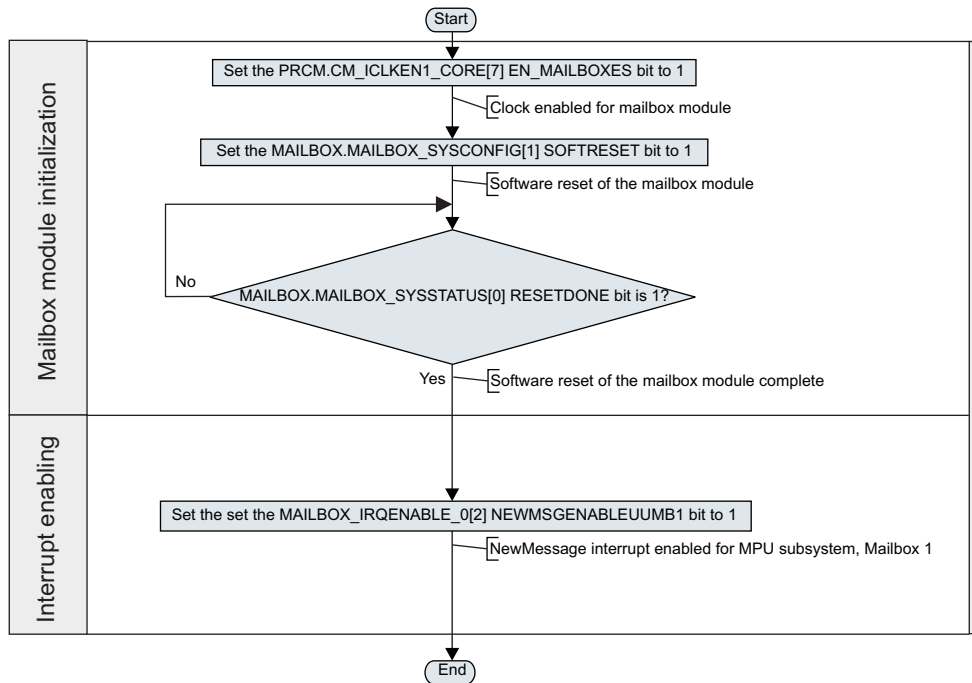

Table 6-3. Register Print After the Interrupt Enabling

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_IRQENABLE_0	0x4809 4104	0x0000 0004	NEWMSGENABLEUUMB1 bit is set to 1 to enable the NewMessage interrupt to the MPU subsystem on mailbox 1

6.5.1.2.1.3 Initial Configuration Flow Chart

Figure 6-6 describes the programming flow chart corresponding to the initial configuration.

Figure 6-6. Initial Configuration Flow Chart

ipc-006

6.5.1.2.2 Operational Mode

For the Camcorder use case, the communication between the MPU and the IVA2.2 subsystems is done in four parts:

1. MPU subsystem message sending (polling method)
2. IVA2.2 subsystem message receiving (polling method)
3. IVA2.2 subsystem message sending (polling method)
4. MPU subsystem message receiving (interrupt method)

6.5.1.2.2.1 MPU Subsystem Message Sending (Polling Method)

To send a message with mailbox 0 using the polling method, the MPU subsystem follows these steps:

1. Poll the MAILBOX_MAILBOX_FIFOSTATUS_0[0] FIFOFULLMB bit until it is cleared to 0 by the mailbox module to indicate that the mailbox 0 message queue is not full
2. Write the message into the MAILBOX_MAILBOX_MESSAGE_0 register

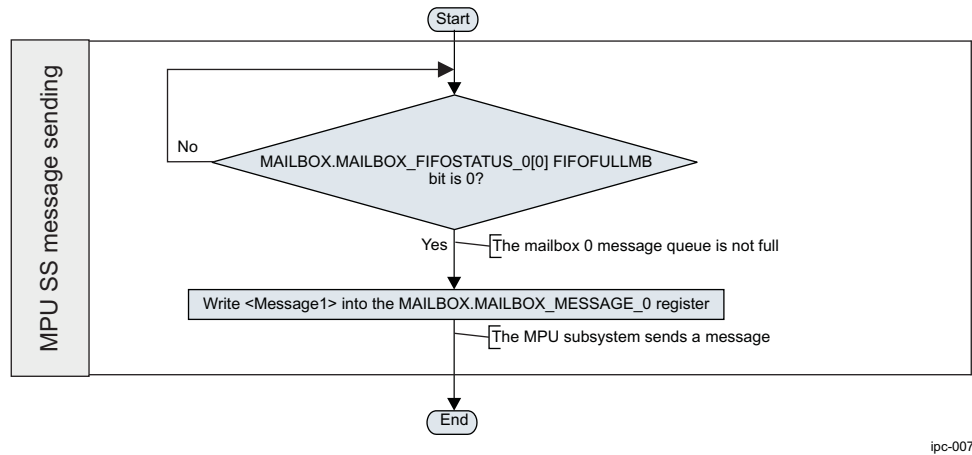

Table 6-4 shows all the registers to be configured for the MPU subsystem message sending.

Table 6-4. Register Print After the MPU Subsystem Message Sending

Register Name	Physical Address	Value	Value Description
MAILBOX_MAILBOX_FIFOSTATUS_0	0x4809 4080	0x0000 0000	FIFOFULLMB bit is cleared to 0 when the mailbox 0 message queue is not full
MAILBOX_MAILBOX_MESSAGE_0	0x4809 4040	<Message1>	<Message1> is written into the MAILBOX_MAILBOX_MESSAGE_0 register

Figure 6-7 describes the programming flow chart corresponding to the MPU subsystem message sending.

Figure 6-7. MPU Subsystem Message Sending Flow Chart

ipc-007

6.5.1.2.2.2 IVA2.2 Subsystem Message Receiving (Polling Method)

To receive a message with mailbox 0 using the polling method, the IVA2.2 subsystem follows these steps:

1. Poll the MAILBOX.MAILBOX_MSGSTATUS_0[2:0] NBOFMSGMB field until it is set to 0x1 to detect a new message in mailbox 0
2. Read the message into the MAILBOX.MAILBOX_MESSAGE_0 register

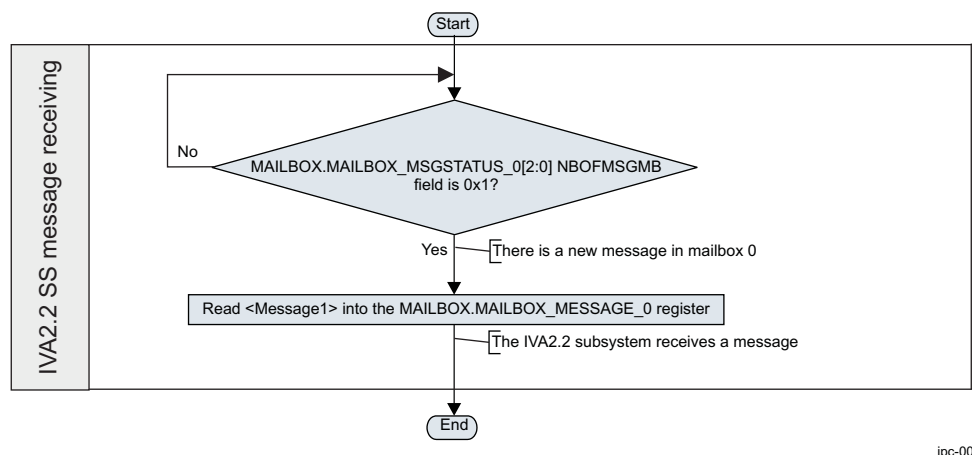

Table 6-5 shows all the registers to be configured for the IVA2.2 subsystem message receiving.

Table 6-5. Register Print After the IVA2.2 Subsystem Message Receiving

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_MSGSTATUS_0	0x4809 40C0	0x0000 0001	NBOFMSGMB field is set to 0x1. <Message1> is received.
MAILBOX.MAILBOX_MESSAGE_0	0x4809 4040	<Message1>	<Message1> is read into the MAILBOX.MAILBOX_MESSAGE_0 register

Figure 6-8 describes the programming flow chart corresponding to the IVA2.2 subsystem message receiving. See Section 6.5.1.2.2.2, IVA2.2 Subsystem Message Receiving (Polling Method), for more information.

Figure 6-8. IVA2.2 Subsystem Message Receiving Flow Chart

ipc-008

6.5.1.2.2.3 IVA2.2 Subsystem Message Sending (Polling Method)

When the IVA2.2 subsystem data processing is done, mailbox 1 is used to send a message. After sending the message, a NewMessage interrupt is generated and received by the MPU subsystem. To send a message with mailbox 1 using the polling method, the IVA2.2 subsystem follows these steps:

1. Poll the MAILBOX.MAILBOX_FIFOSTATUS_1[0] FIFOFULLMB bit until it is cleared to 0 by the mailbox module to indicate that the mailbox 0 message queue is not full.
2. Write the message into the MAILBOX.MAILBOX_MESSAGE_1 register.

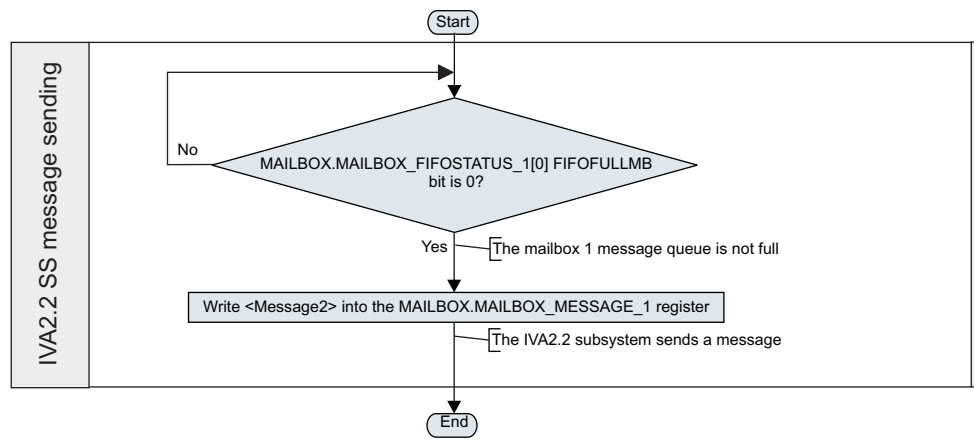

Table 6-6 shows all the registers to be configured for the IVA2.2 subsystem message sending.

Table 6-6. Register Print After the IVA2.2 Subsystem Message Sending

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_FIFOSTATUS_1	0x4809 4084	0x0000 0000	FIFOFULLMB bit is cleared to 0 when the FIFO is not full
MAILBOX.MAILBOX_MESSAGE_1	0x4809 4044	<Message2>	<Message2> is written into the MAILBOX.MAILBOX_MESSAGE_1 register

Figure 6-9 describes the programming flow chart corresponding to the IVA2.2 subsystem message sending. See Section 6.5.1.2.2.3 for more information.

Figure 6-9. IVA2.2 Subsystem Message Sending Flow Chart

ipc-009

6.5.1.2.2.4 MPU Subsystem Message Receiving (Interrupt Method)

After receiving a NewMessage interrupt (indicating a new message is received), the MPU subsystem reads the message from the IVA2.2 subsystem. To receive a message with mailbox 0 using the polling method, the MPU subsystem follows these steps:

1. Read the MAILBOX_IRQSTATUS_0[2] NEWMSGSTATUSUMB1 bit
2. Read the message into the MAILBOX_MESSAGE_1 register
3. Set the MAILBOX_IRQSTATUS_0[2] NEWMSGSTATUSUMB1 bit to 1 to clear the interrupt flag

Table 6-7 shows all the registers to be configured for the MPU subsystem message receiving.

Table 6-7. Register Print After the MPU Subsystem Message Receiving

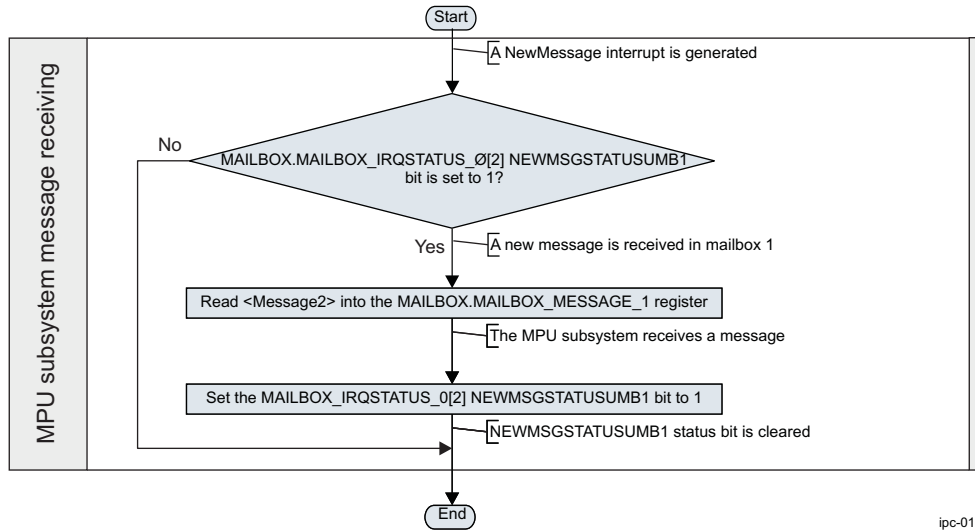

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_IRQSTATUS_0	0x4809 4100	0x0000 0004	A NewMessage interrupt is generated. NEWMSGSTATUSUMB1 status bit is set to 1.
MAILBOX.MAILBOX_MESSAGE_1	0x4809 4044	<Message2>	<Message2> is read into the MAILBOX.MAILBOX_MESSAGE_1 register

Table 6-7. Register Print After the MPU Subsystem Message Receiving (continued)

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_IRQSTATUS_0	0x4809 4100	0x0000 0000	NEWMSGSTATUSUMB1 status bit is cleared

Figure 6-10 describes the programming flow chart corresponding to the MPU subsystem message receiving. See Section 6.5.1.2.2.4 for more information.

⁽¹⁾ m = 0 to 1

⁽²⁾ u = 0 to 1

NOTE: In MAILBOX_MESSAGE_0, MAILBOX_MESSAGE_1, MAILBOX_FIFOSTATUS_0, MAILBOX_FIFOSTATUS_1, MAILBOX_MSGSTATUS_0, and MAILBOX_MSGSTATUS_1 register names, 0 or 1 is the mailbox number.

In MAILBOX_IRQSTATUS_0, MAILBOX_IRQSTATUS_1, MAILBOX_IRQENABLE_0, and MAILBOX_IRQENABLE_1 register names, 0 or 1 is the user number:

- User 0: MPU subsystem
- User 1: IVA2.2 subsystem

6.6.2 Register Description

Table 6-10 through Table 6-24 describe the register bits.

System Control Module

This chapter describes the system control module (SCM).

NOTE: Some features may not be available or supported in your particular device. For more information, see Chapter 1, the Device Family section, and your device-specific data manual.

Topic	Page
7.1 SCM Overview	760
7.2 SCM Environment	761
7.3 SCM Integration	762
7.4 SCM Functional Description	766
7.5 SCM Programming Model	841
7.6 SCM Register Manual	852

7.1 SCM Overview

The system control module (SCM) allows software control of the various static modes supported by the device. The SCM is on the L4-Core interconnect, but it is sensitive only to the device internal power-on reset. It is not affected by the L4-Core reset.

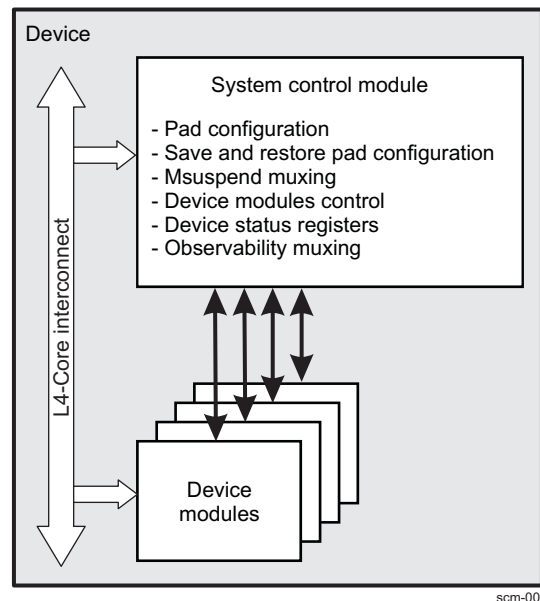

For emulator devices, the power-on reset can also be controlled by the debugger through the JTAG interface.

The device uses the SCM as the primary point of control for these areas:

- Functional I/O multiplexing
- Pad configuration (pull-up or pull-down enable)
- Device status
- Peripheral sensitivity to the MPU and/or the DSP (IVA2.2) MSuspend signals
- Static device configuration
- Debug and observability I/O multiplexing
- Save-and-restore pad configuration

Figure 7-1 provides an overview of the SCM.

Figure 7-1. SCM Overview

The SCM primarily implements a bank of registers accessible by the software. Some are read-only registers that carry status information, and others are fully accessible (read/write).

The read/write registers are divided into the following classes:

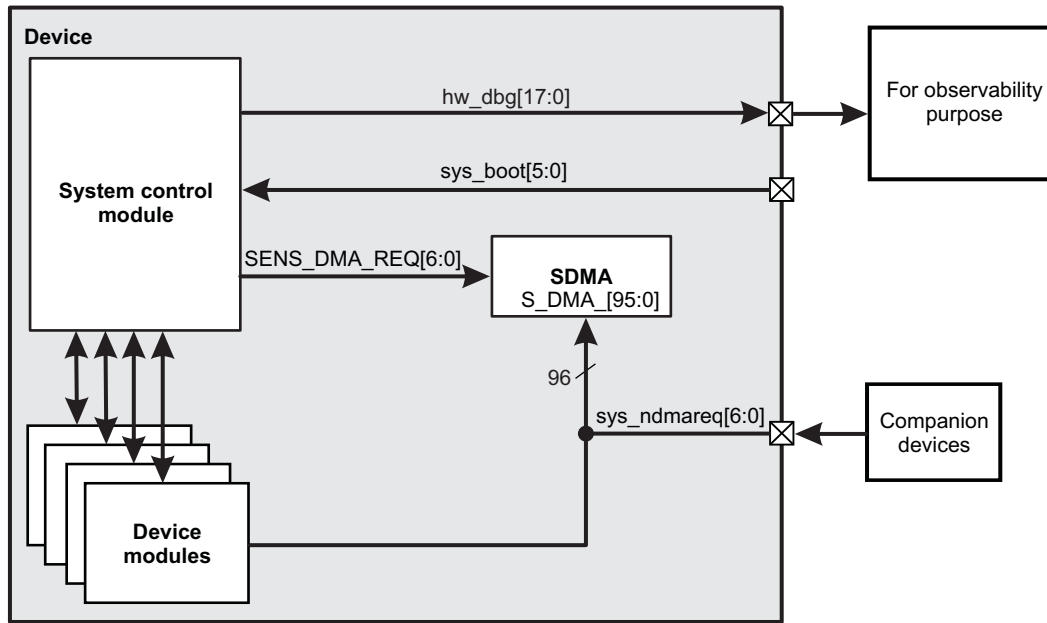

- Pad functional multiplexing and configuration registers (32-bit registers, one register per two pins)
- Debug and observability I/O multiplexing register (32-bit read/write register)
- Static device configuration registers (32-bit read/write registers for module specific configuration)
- Scratchpad memory bank (256* 32-bit)

7.2 SCM Environment

The SCM allows the setting of external system DMA (sDMA) request pin sensitivity and controls the multiplexing of device internal modules signals routed to external pins for hardware debug purposes. The SCM also integrates the decoding logic of sys_boot[5:0].

Figure 7-2 shows an overview of the SCM environment.

Figure 7-2. SCM Environment Overview

108-002

The seven sys_ndmareq[6:0] pins are optional external direct memory access (DMA) requests that can be managed directly by the sDMA controller. The SCM can configure these requests to either level sensitive (active low) or edge sensitive (falling edge) through the correct setting of the SENSMDAREQN bit (where N is between 0 and 6) in the CONTROL.CONTROL_DEVCONF0 and CONTROL.CONTROL_DEVCONF1 registers.

The sys_boot[5:0] pins are read-accessible in a status register (SYSBOOT field CONTROL.CONTROL_STATUS[5:0]) following a power-on reset. The SCM does not use sys_boot[6].

With the correct pad configuration, the SCM maps the hw_dbg[17:0] pins at the device boundary to observe hardware debug signals from device modules. The internal observable signals are PRCM signals, DMA requests, and interrupts.

7.2.1 Functional Interfaces

7.2.1.1 Basic SCM Pins

Figure 7-3 shows the SCM functional interface configured to observe device module debug signals.

Figure 7-3. SCM Interface Signals

108-003

7.2.1.2 SCM Interface Description

Table 7-1 lists the SCM input and output configured to observe device module debug signals.

Table 7-1. SCM I/O Description

Signal Name	I/O ⁽¹⁾	Description	Reset Value
hw_dbg[17:0]	O	Debug signals 0 to 17	N/A
sys_boot[5:0]	I	Boot configuration mode bits 0 to 5	Unknown

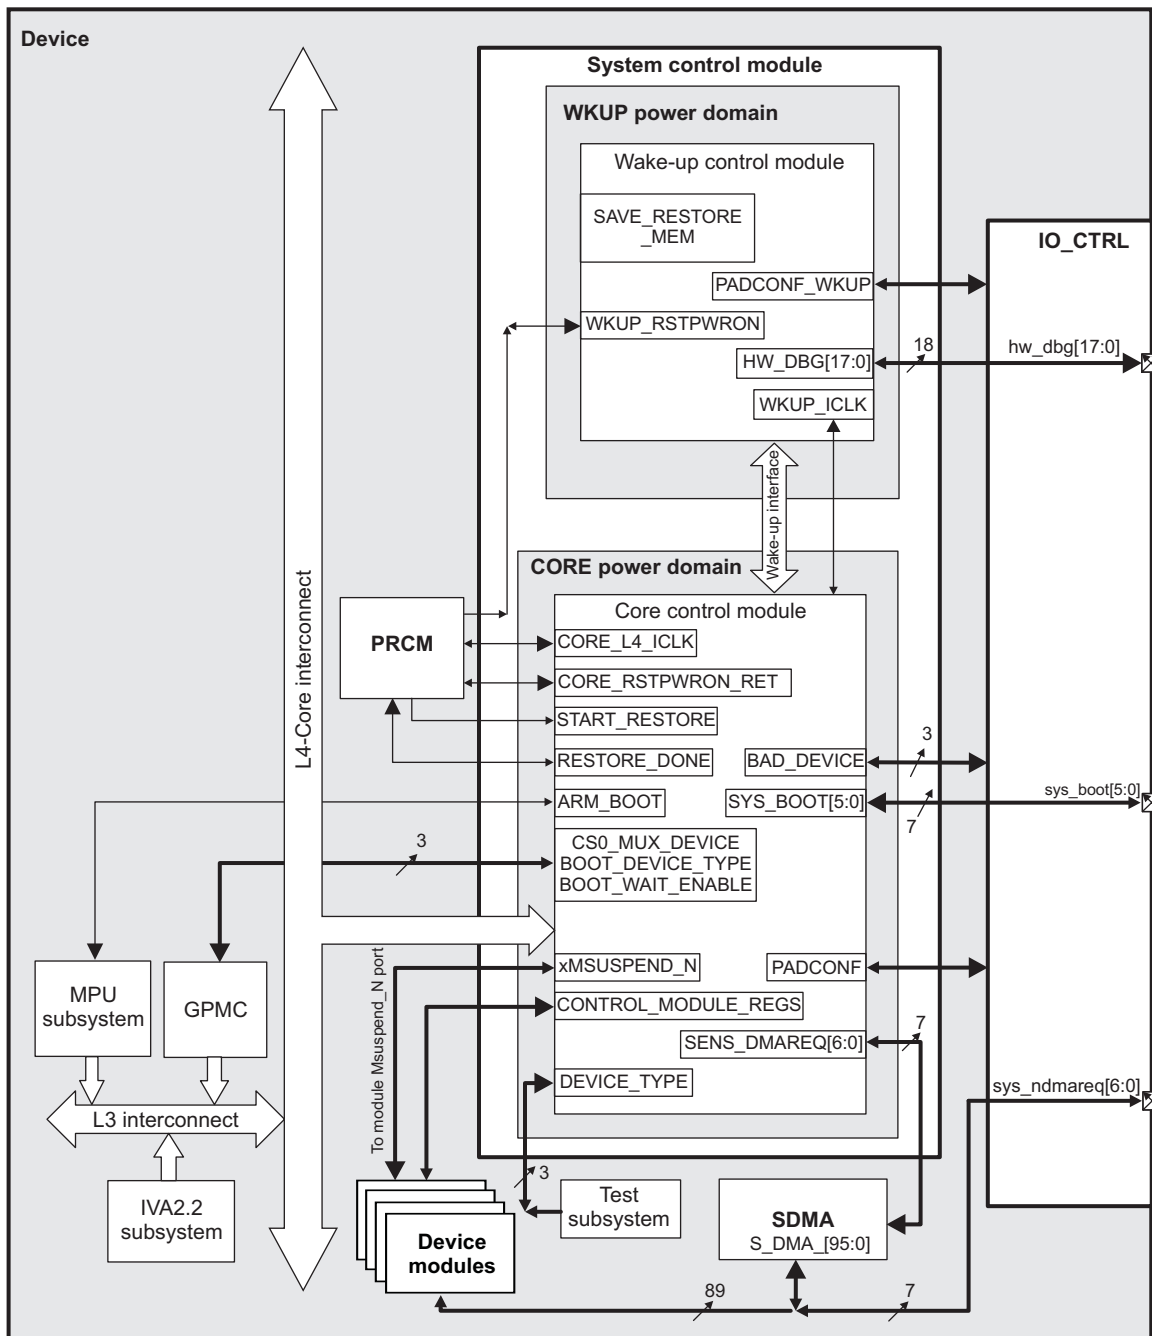

⁽¹⁾ I = Input, O = Output

7.3 SCM Integration

This section describes the integration of the SCM within the device.

Figure 7-4 shows the SCM integration in the device.

Figure 7-4. SCM Integration

scm-004

The SCM is split into two blocks: the core control module in the CORE power domain, and the wake-up control module in the WKUP power domain. The wake-up control module contains the save-and-restore memory, some observability multiplexing and pad configurations. For more information about the wake-up control module, see [Section 7.4.3, Wake-up Control Module](#).

The software sets the configuration registers to the desired values depending on the configuration of the requested device. Static device configuration registers can be set by the software at any time and are effective immediately.

The SCM is connected on the L4-Core interconnect. The power, reset, and clock management (PRCM) module provides the module interface clock (CORE_L4_ICLK) and the power-on reset signal. The PRCM generates one global reset per power domain (CORE_RSTPWRON_RET for the CORE power domain and WKUP_RSTPWRON for the WKUP power domain). The SCM does not respond to a warm reset or to an L4 reset.

7.3.1 Clocking, Reset, and Power-Management Scheme

7.3.1.1 Clock

The main sequential logic within the SCM is accessible in a register file through the L4-Core. The only clock provided to the SCM is the interface clock, CORE_L4_ICLK. This clock comes from the PRCM module and is controlled by the EN_OMAPCTRL bit PRCM.CM_ICLKEN1_CORE[6] (0 = disables the clock, 1 = enables the clock) and the AUTO_OMAPCTRL bit PRCM.CM_AUTOIDLE1_CORE[6] (enables/disables automatic control of the interface clock).

The wake-up control module is configured through the L4-Core interface of the core control module and is accessed from the core control module through a dedicated interface. This interface uses the L4-Core interface clock (CORE_L4_ICLK) divided by 4 or 2 according to the WKUPCTRLCLOCKDIV bit CONTROL.CONTROL_PADCONF_OFF[2]. Only this wake-up interface clock (WKUP_ICLK) is propagated to the wake-up control module.

For further information, see [Chapter 4, Power, Reset, and Clock Management](#).

7.3.1.2 Resets

The SCM responds only to the internal power-on reset and to the device type. The SOFTRESET bit CONTROL.CONTROL_SYSCONFIG[1] has no effect; the SCM is not affected by a warm reset.

The internal power-on reset is not a direct image of the power-on reset input pin (SYS_NRESPWRON). The PRCM module generates an internal power-on reset signal per power domain and activates the internal power-on reset when the eFuse-related settings (such as the device type) are initialized. The core control module of the CORE power domain responds to the CORE power-on reset (CORE_RSTPWRON_RET). The wake-up control module of the WKUP power domain responds to the power-on reset (WKUP_RSTPWRON).

NOTE: References in the TRM to the power-on reset refer to the internal power-on reset as seen by the SCM.

On emulator devices, the debugger can also control the internal power-on reset signal through the JTAG interface.

For further information, see [Chapter 4, Power, Reset, and Clock Management](#).

7.3.1.3 Power Domain

The SCM is split into two blocks: the core control module, which is attached to the CORE power domain and can be in either active, retention, or off state, and the wake-up control module, which belongs to the WKUP power domain.

NOTE: The SCM is fully built with retention Flip-Flop.

For further information, see [Chapter 4, Power, Reset, and Clock Management](#).

7.3.1.4 Power Management

7.3.1.4.1 System Power Management

The PRCM module can require the SCM to be idled to save power. The SCM enters idle mode through the IDLEMODE field CONTROL.[CONTROL_SYSCONFIG](#)[4:3].

The PRCM module requests idle mode, and the SCM always accepts an idle command. Idle mode can be configured to either force-idle or smart-idle mode.

When the SCM is in force-idle mode (IDLEMODE bits CONTROL.[CONTROL_SYSCONFIG](#)[4:3] = 0b00) and it receives an idle request from the PRCM module (PRCM.CM_ICLKEN1_CORE[6] set to 0 or PRCM.CM_AUTOIDLE1_CORE[6] set to 1 and the L4-Core interface clock idle transitions), the SCM waits unconditionally for active system clock gating by the PRCM module. Active system clock gating occurs only when all peripherals supplied by the same L4-Core interface clock domain are also ready for idle.

In smart-idle mode (IDLEMODE bits CONTROL.[CONTROL_SYSCONFIG](#)[4:3] = 0b10), an idle command is accepted only when the save mechanism completes.

In idle mode (when the PRCM module has gated the interface clock), the SCM is not active and the interface clock paths are gated.

NOTE: The ST_OMAPCTRL bit PRCM.CM_IDLEST1_CORE[6] (0b0 = active, 0b1 = idle) can check the SCM idle state.

The SCM idle mode is a function of the EN_OMAPCTRL bit PRCM.CM_ICLKEN1_CORE[6] configuration and can be controlled automatically with hardware, depending on the AUTO_OMAPCTRL bit PRCM.CM_AUTOIDLE1_CORE[6] configuration.

7.3.1.4.2 Module Power Saving

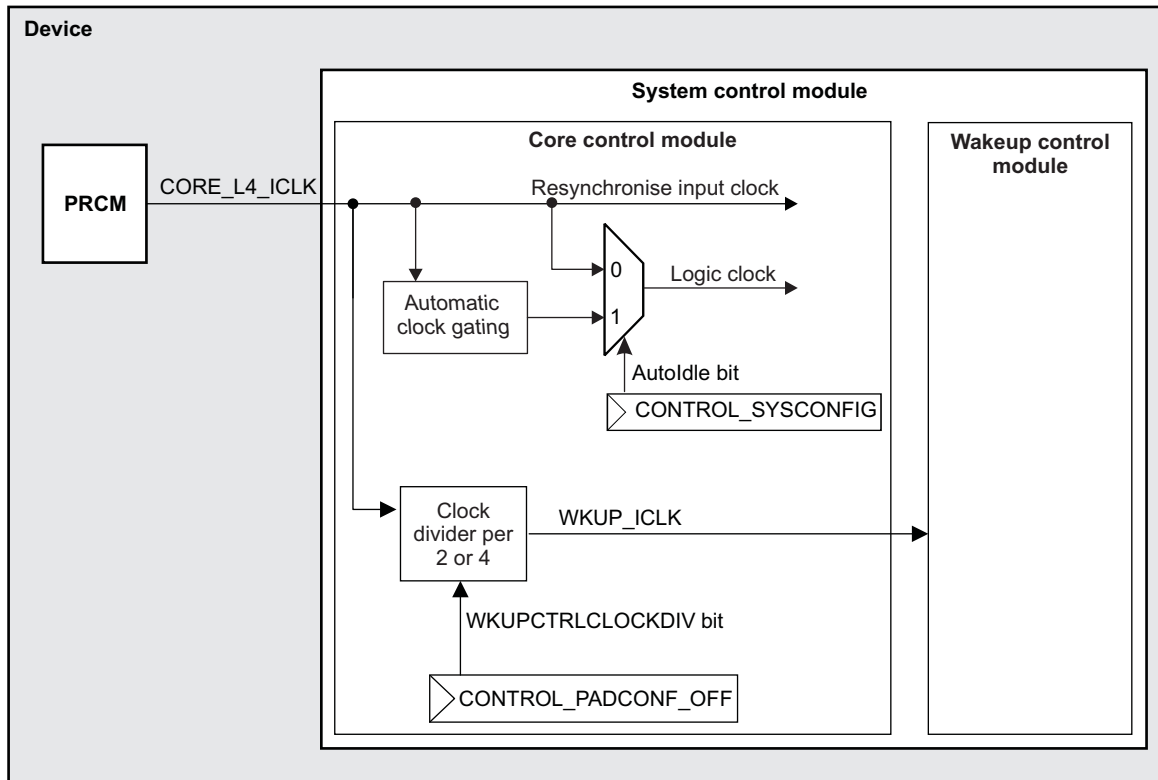

An internal interface clock-gating feature provides SCM local power management. The clock for the logic within the module can be gated when there is no access to the module according to the AUTOIDLE bit CONTROL.[CONTROL_SYSCONFIG](#)[0]. Otherwise, this logic is free-running on the interface clock CORE_L4_ICLK.

The L4-Core interface clock (CORE_L4_ICLK) is also used to synchronize and resample module inputs. The clock for those functions must always be free-running. Therefore, it is not gated.

The wake-up control module is clocked only by a local wake-up interface clock from the core control module. The wake-up interface clock (WKUP_ICLK) uses the L4-Core interface clock (CORE_L4_ICLK) divided by 4 or 2 to reduce power consumption according to the WKUPCTRLCLOCKDIV bit CONTROL.[CONTROL_PADCONF_OFF](#)[2] (0 = divided by 4, 1 = divided by 2).

[Figure 7-5](#) shows the SCM internal clock implementation.

Figure 7-5. Internal Clock Implementation

108-005

7.3.2 Hardware Requests

The SCM does not generate interrupt or wake-up requests.

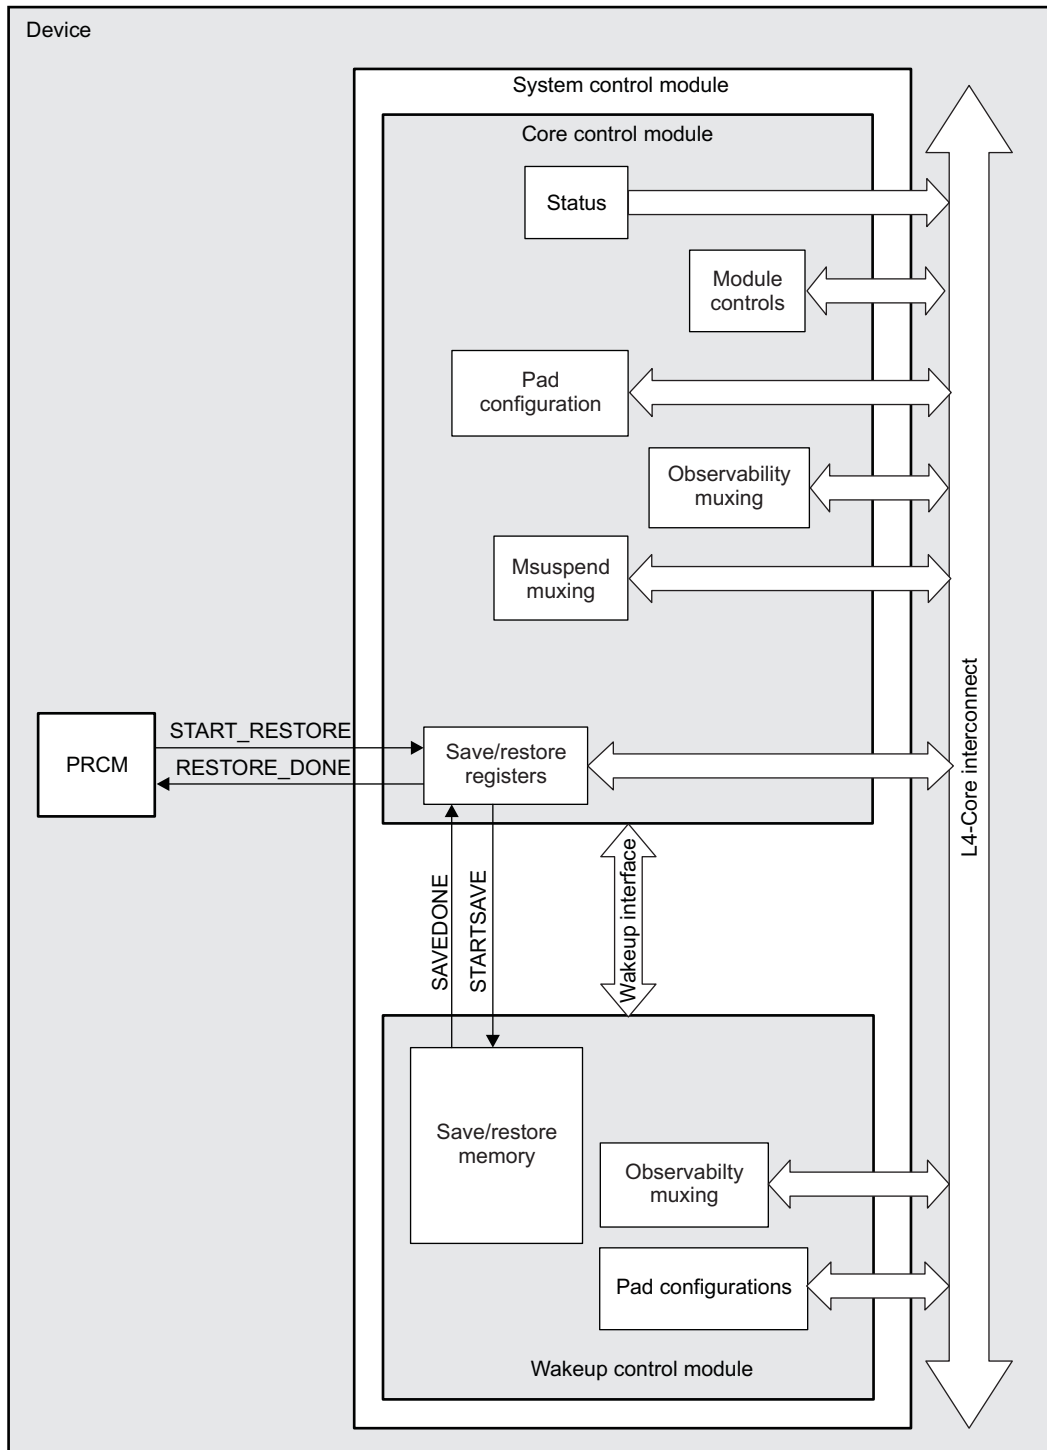

7.4 SCM Functional Description

7.4.1 Block Diagram

The SCM controls various device modules settings through register configuration and internal signals. It also controls the pad configuration and multiplexing and the routing of internal signals (such as PRCM signals or DMA requests) to observable pins for debug.

Figure 7-6 shows the SCM block diagram.

Figure 7-6. SCM Block Diagram

scm-006

The following sections describe the functionality of the SCM registers.

7.4.2 SCM Initialization

The SCM responds only to the internal power-on reset and to the device type. At power-on, reset values for the registers define the safe state for the device. In the initialization mode, only modules used at boot time are associated with the pads. Other module inputs are internally tied, and outputs pads are turned off each time the feature is available.

For the pad configuration, pull-up/pull-down fields are set according to the device pin list.

General-purpose devices include features that are inaccessible or unavailable. These inaccessible registers define the default or fixed device configuration or behavior.

7.4.3 Wake-up Control Module

The wake-up control module in the SCM belongs to the WKUP power domain. It contains a 1K-byte memory in which to save the pad configuration registers in the core control module before going to off mode. Pad configuration registers driving the I/O pad control in the WKUP power domain are also instantiated in the wake-up control module.

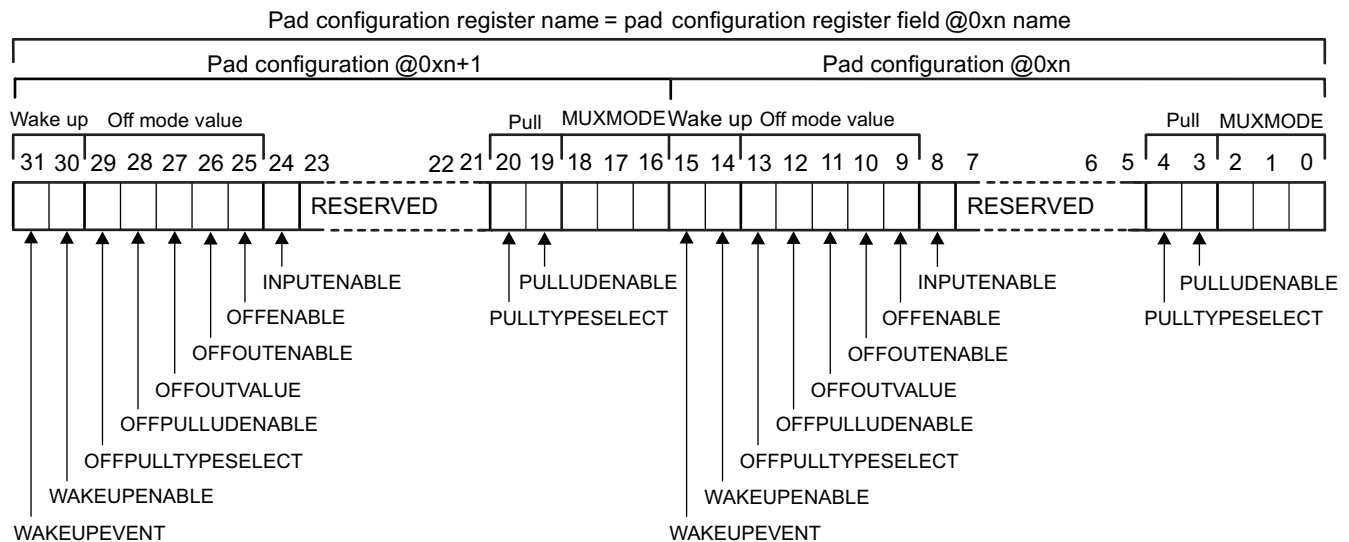

The wake-up control module is configured through the L4-Core interface in the core control module and is accessed from the core control module through a dedicated interface. This interface between the core control module and the wake-up control module uses the CORE_L4_ICLK clock divided by 4 or 2 to reduce power consumption in the WKUP power domain.

7.4.4 Pad Functional Multiplexing and Configuration

After power-on reset, the software sets the pad functional multiplexing and configuration registers to the requested device pad configurations. Data written in these registers command directly the multiplexing of the pad configuration logic.

Each pin is configurable by software using its associated pad configuration register field, which is 16 bits wide (see [Figure 7-7](#)).

Figure 7-7. Pad Configuration Register Functionality

One pad configuration register field is available for each pin. Each 32-bit pad configuration register is grouped into two 16-bit pad configuration register fields. One pad configuration register provides control for two different pins.

Some pad configuration registers control the configuration of pads in the CORE power domain. These registers are instantiated in the CORE power domain of the SCM (core control module, physical addresses 0x4800 2030 to 0x4800 2260). Pad configuration registers also control the configuration of pads in the WKUP power domain. These registers are instantiated in the WKUP power domain of the SCM (wake-up control module, physical addresses 0x4800 2A00 to 0x4800 2A4C).

NOTE: These registers can be accessed using 8-, 16-, and 32-bit operations.

The functional bits of a pad configuration register field are divided into the following five fields:

- MUXMODE (3 bits) defines the multiplexing mode applied to the pin. A mode corresponds to the selection of the functionality mapped on the pin with six (0 to 5) possible functional modes for each pin.
- PULL (2 bits) for combinational pullup/pulldown configuration:
 - PULLTYPESELECT: Pullup/pulldown selection for the pin.
 - PULLUDENABLE: Pullup/pulldown enable for the pin.
- INPUTENABLE (1 bit) drives an input enable signal to the I/O CTRL.
 - INPUTENABLE = 0: Input Disable. Pin is configured in output only mode.
 - INPUTENABLE = 1: Input Enable. Pin is configured in bidirectional mode.
- Off mode values (5 bits) override the pin state when the OFFENABLE bit CONTROL.
[CONTROL_PADCONF_X](#) is set and off mode is active. This feature allows having separate configurations for the pins when in off mode:
 - OFFENABLE: Off mode pin state override control. Set to 1 to enable the feature and to 0 to disable it.
 - OFFOUTENABLE: Off mode output enable value. Set to 0 to enable the feature and to 1 to disable it.
 - OFFOUTVALUE: Off mode output value.
 - OFFPULLUDENABLE: Off mode pullup/pulldown enable
 - OFFPULLTYPESELECT: Off mode pullup/pulldown selection

CAUTION

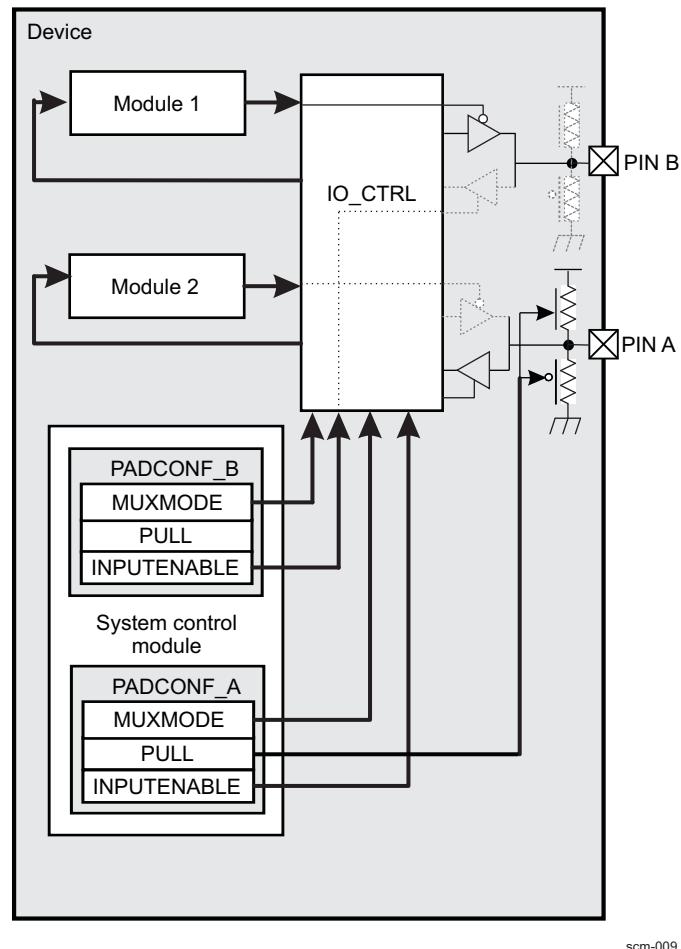

The OFFOUTENABLE and OFFOUTVALUE bits are functional only if the pad configuration supports output mode on at least one MUXMODE. For a pad that supports only the input feature, the OFFOUTENABLE and OFFOUTVALUE bits cannot be configured (they are don't care and read always returns 0).

- Wake-up bits (2 bits):
 - WAKEUPENABLE: Enable wake-up detection on input. It is also the off mode input enable value.
 - WAKEUPEVENT: Wake-up event status for the pin.

CAUTION

The software must configure the OFF mode pads. It must ensure that the input/output capability is enabled for each pin.

Figure 7-8 shows the pad configuration functionality when off mode is inactive. For more information about off mode, see [Section 7.4.4.4, Off Mode](#).

Figure 7-8. Pad Configuration Diagram

scm-009

7.4.4.1 Mode Selection

Table 7-2 lists the multiplexing modes and settings.

Table 7-2. Mode Selection

MUXMODE	Selected Mode
0b000	Primary mode = Mode 0
0b001	Mode 1
0b010	Mode 2
0b011	Mode 3
0b100	Mode 4
0b101	Mode 5
0b110	Mode 6
0b111	Safe mode = Mode 7

The MUXMODE field CONTROL. [CONTROL_PADCONF_X](#) defines the multiplexing mode applied to the pad. Modes are referred to by their decimal (from 0 to 7) or binary (from 0b000 to 0b111) representation. Functional modes are defined from 0b000 to 0b101; mode 0b111 is referred to as the safe mode.

For most pads, the reset value for the MUXMODE field CONTROL. [CONTROL_PADCONF_X](#) is 0b111. The exceptions are pads to be used at boot time to transfer data from selected peripherals to the external flash memory.

Mode 0 is the primary mode. When mode 0 is set, the function mapped to the pin corresponds to the name of the pin.

Mode 1 to mode 6 are possible modes for alternate functions. On each pin, some modes are used effectively for alternate functions, while other modes are unused and correspond to no functional configuration.

The safe mode avoids any risk of electrical contention by configuring the pin as an input with no functional interface mapped to it. The safe mode is used mainly as the default mode for all pins containing no mandatory interface at the release of power-on reset.

For more information about the configurable mode on each pin, see [Table 7-4](#) through [Table 7-6](#).

7.4.4.2 Pull Selection

Whichever pull value is configured, pulls are automatically disabled when a pin is configured as an output (see [Table 7-3](#)).

Table 7-3. Pull Selection

PULL		Pin Behavior
PULLTYPESELECT	PULLUDENABLE	
0b0	0b0	Pull-down selected but not activated
0b0	0b1	Pull-down selected and activated if pin is NOT configured as OUTPUT
0b1	0b0	Pull-up selected but not activated
0b1	0b1	Pull-up selected and activated if pin is NOT configured as OUTPUT

For more information on the pull available on each pin, see [Table 7-4](#) through [Table 7-6](#).

7.4.4.3 Pad Multiplexing Register Fields

Table 7-4 through Table 7-6 provide for each pad configuration register field the address offset, reset values, and associated signal name for each multiplexing mode (as set by bit field MUXMODE). Mode 0 is always defined. Modes with no signal name are undefined for the given pad.

NOTE:

- Pad configuration registers are split into three types, which correspond to the following three tables:
 - Table 7-4 lists the pad configuration registers instantiated in the CORE power domain that drive the pads in the CORE power domain.
 - Table 7-5 lists the pad configuration registers instantiated in the CORE power domain that drive the D2D pads. These pads are available in stacked mode only.
 - Table 7-6 lists the pad configuration registers instantiated in the WKUP power domain that drive the pads in the WKUP power domain.
- In Table 7-4 through Table 7-6, an empty cell indicates that the mode or pull is not available for this pin.

Table 7-4. Core Control Module Pad Configuration Register Fields

Register Name	Physical Address	Mode 0	Mode 1	Mode 2	Mode 3	Mode 4	Mode 5	Mode 6	Mode 7

⁽¹⁾ The D2D_swakeup pad is available in stacked mode only.

NOTE: For proper functioning of the following modules, CONTROL_PADCONF_x.INPUTENABLE must be set to 1 for pads configured to drive output clocks:

- SDRC
 - GPMC
 - McSPi
 - I2Ci
 - MMCi
 - McBSPi
 - HSUSB HOST
-

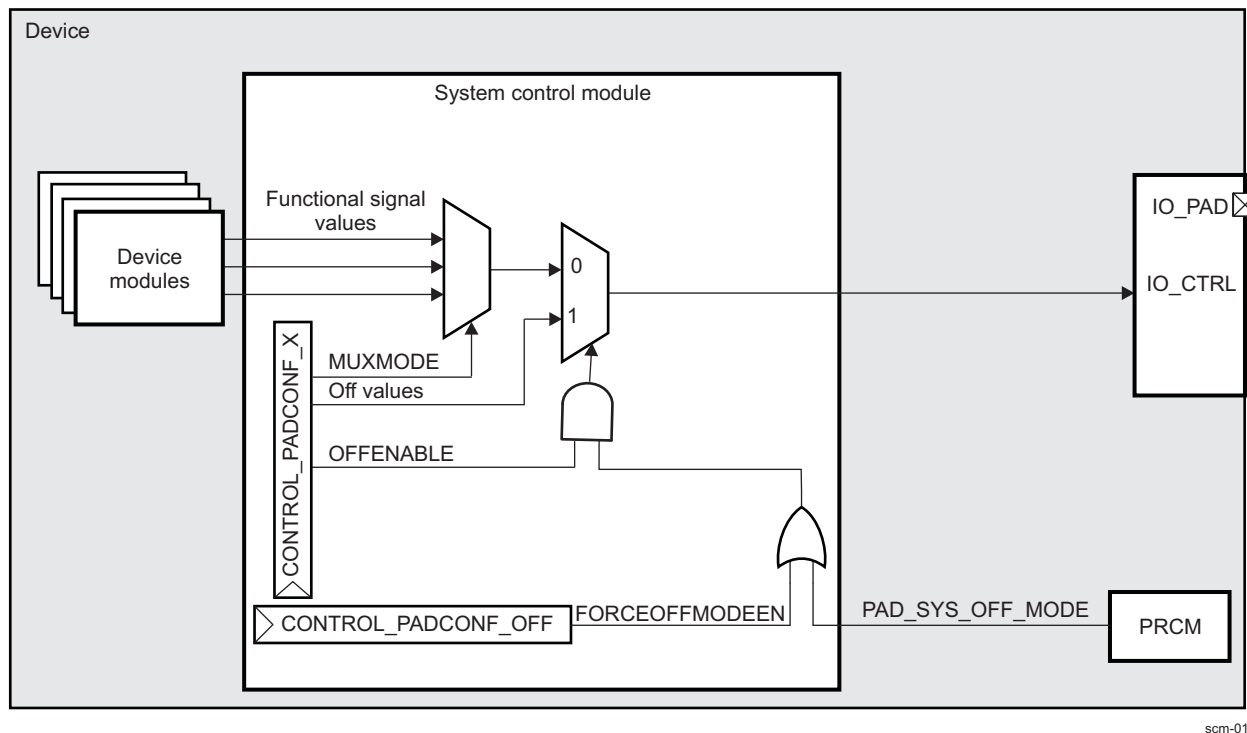

NOTE: Pad names are signal names available in mode 0.

7.4.4.4 System Off Mode

When off mode is active (PAD_SYS_OFF_MODE = 0b1 from PRCM or FORCEOFFMODEENABLE bit CONTROL.CONTROL_PADCONF_OFF[0] = 0b1), the off mode values field CONTROL.CONTROL_PADCONF_X overrides the pad state when OFFENABLE bit CONTROL.CONTROL_PADCONF_X is set.

Figure 7-9 shows the off mode pad control.

Figure 7-9. System Off Mode Pad Control Overview

scm-010

If off mode is active and the OFFENABLE bit is set to disable, the pad keeps the AND value of the configuration (input/output, PU/PD) it had before going into off mode:

- For an input, the pad is isolated and the pull remains active.
- For an output, the value is latched before going into off mode, to drive the same value in off mode

For more information about off mode, see [Chapter 4, Power, Reset, and Clock Management](#).

For more information about the preliminary settings that must be done before performing OFF <-> ON transitions, see [Section 7.5.3, Off Mode Preliminary Settings](#).

7.4.4.4.1 Save-and-Restore Mechanism

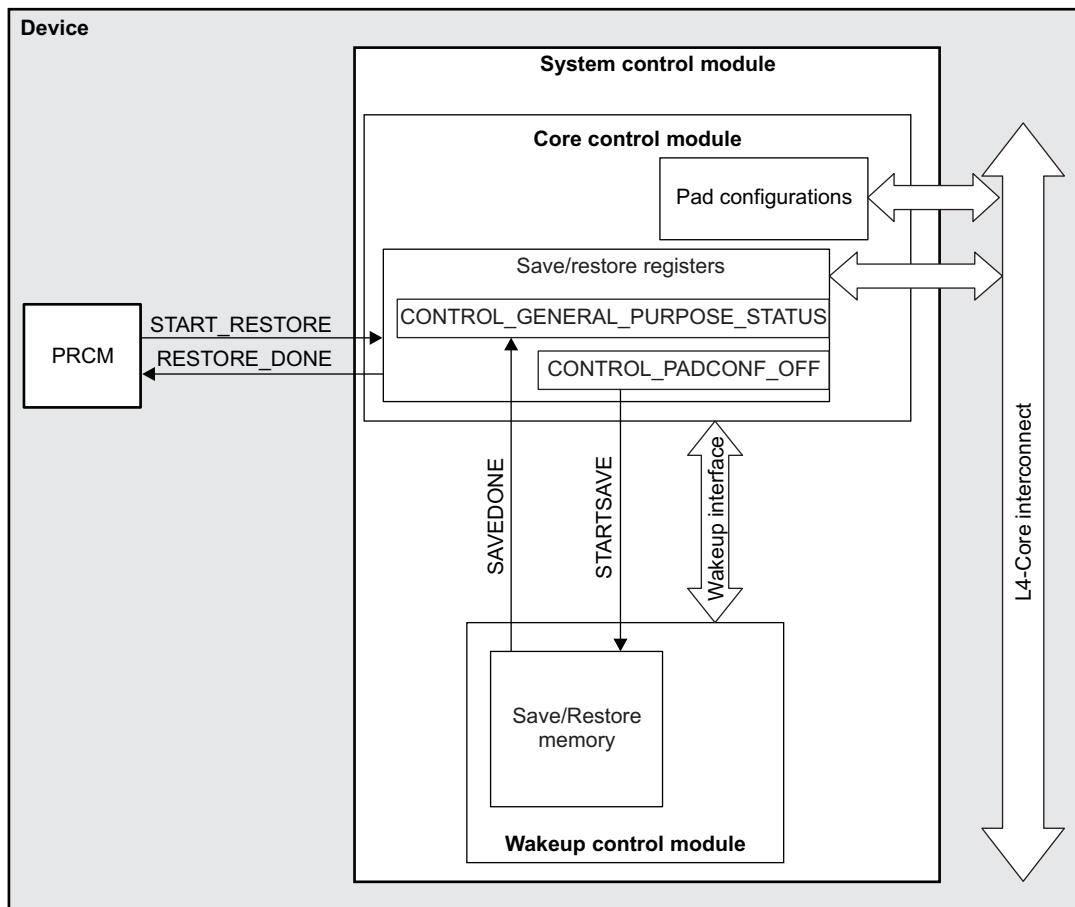

Before going to off mode there is a context saving of the device. The save-and-restore mechanism saves the pad configuration registers (in the CORE power domain) in a WKUP power domain memory (physical addresses 0x4800 2600 to 0x4800 29FC) before going to off mode, and restores those registers when returning from off mode. This mechanism uses the dedicated wake-up interface between the core control module and the wake-up control module.

The save mechanism in the pad configuration registers is activated by setting the STARTSAVE bit `CONTROL.CONTROL_PADCONF_OFF[1]`. When all pad configuration registers have been saved to the wake-up memory, the status SAVEDONE bit `CONTROL.CONTROL_GENERAL_PURPOSE_STATUS[0]` is set. In smart-idle mode, the idleAck is returned when the save process is complete.

When returning from off mode, the registers are restored after the PRCM module asserts the START_RESTORE signal. The SCM returns a RESTORE_DONE signal to the PRCM module when the restore process completes.

Figure 7-10 shows an overview of the save-and-restore mechanism in off mode.

Figure 7-10. Save-and-Restore Mechanism Overview

108-011

7.4.4.4.2 Wake-Up Event Detection

In off mode, wake-up event detection can also be enabled on an input pad. The pad wake-up event is latched in the WAKEUPEVENT bit `CONTROL.CONTROL_PADCONF_X`.

The off mode I/O pads wake-up scheme is enabled by setting the EN_I/O bit `PRCM.PM_WKEN_WKUP[8]`. The wake-up scheme status is transmitted by the `WKUP_ENABLE` signal. The wake-up event detection capability of each I/O pad of the device is individually enabled/disabled by writing WAKEUPENABLE bit `CONTROL.CONTROL_PADCONF_X`.

Figure 7-11. Wake-Up Event Detection Overview

For more information about the wake-up sequences, see [Chapter 4, Power, Reset, and Clock Management](#).

NOTE: When wake-up detection is enabled for a pad, the pad must be configured as input to avoid contention between the OMAP output buffer and an external driver. If this pin is already configured as an input in active mode, hardware automatically retains the same input state; no software action is required.

If this pin is configured as an output in active mode, the OFF override function must be enabled to set the pin as an input during off mode: in the CONTROL.CONTROL_PADCONF register, set OFFENABLE to 0x1 to enable the OFF override function, and set OFFOUTENABLE to 0x1 to switch this pin to input mode.

[Table 7-7](#) lists the bit directions of the CONTROL_PADCONF_x registers.

Table 7-7. Bit Directions for CONTROL_PADCONF_x Registers

CONTROL_PADCONF_x Bit	Bit Direction	
	0	1
PULLUDENABLE	Not activated	Activated
PULLTYPESELECT	Pulldown	Pullup
INPUTENABLE	Input enable signal inactive	Input enable signal active
OFFENABLE	Off mode values are invalid.	Off mode values are valid.
OFFOUTENABLE	Output	Input
OFFOUTVALUE	Low	High
OFFPULLUDENABLE	Not activated	Activated
OFFPULLTYPESELECT	Pulldown	Pullup
WAKEUPENABLE	Disable I/O wake-up function.	Enable I/O wake-up function.
WAKEUPEVENT	Wake-up event not detected	Detect wake-up event.

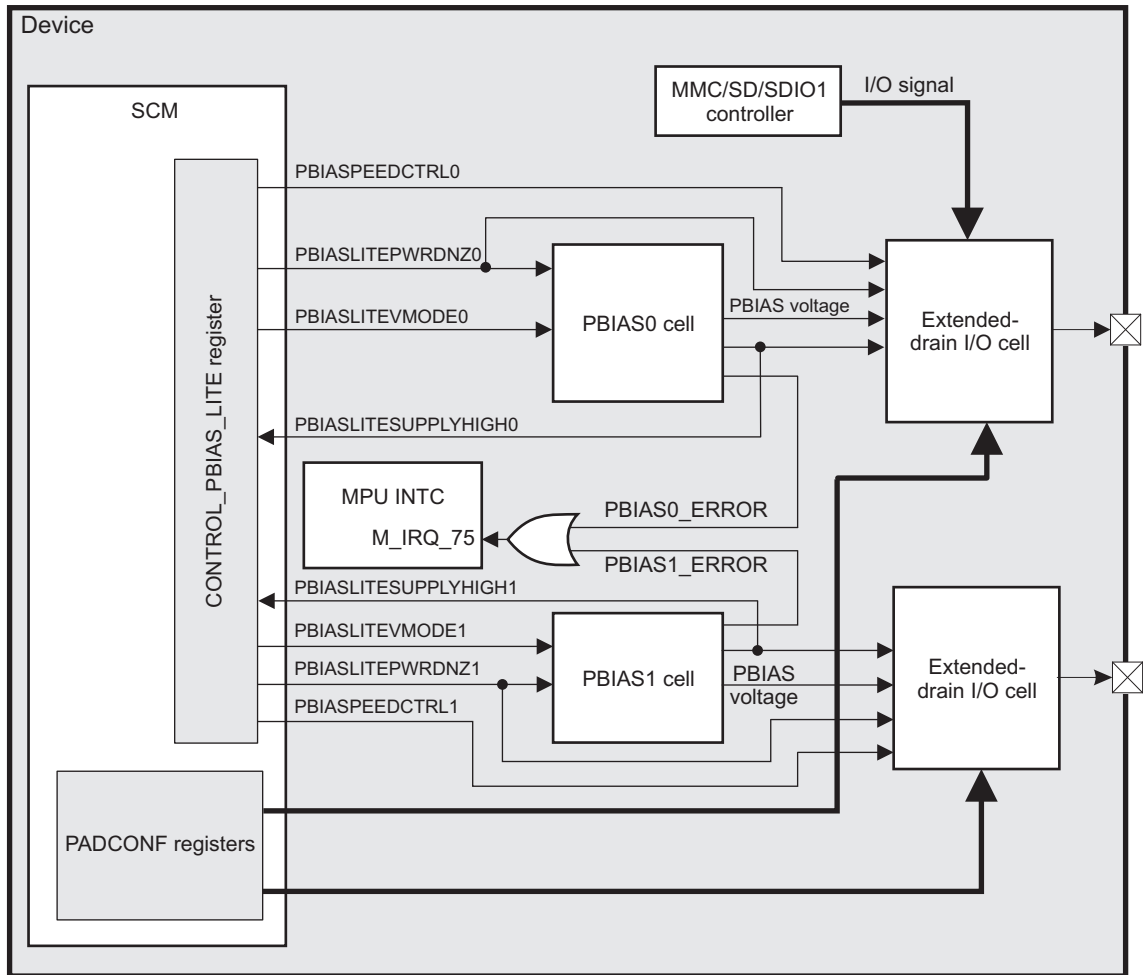

7.4.5 Extended-Drain I/O Pin and PBIAS Cell

The device mainly supports 1.8-V I/O voltage on its interfaces, with the exception of MMC/SD/SDIO1 interface, which support both 1.8-V and 3.0-V voltages via internal PBIAS generation and extended-drain I/Os.

The need for embedded extended-drain I/Os on MMC/SD/SDIO1 interface imposes the use of embedded PBIAS cells to provide 1.8-V or 3.0-V reference voltage. The PBIAS cells and the extended-drain I/Os are software-controlled by bits located in the CONTROL.CONTROL_PBIAS_LITE register of the SCM. See [Section 7.6.3, Register Descriptions](#), for the description of this register.

Figure 7-12 shows the functional block diagram between the PBIAS cells and the extended I/O cells.

Figure 7-12. Functional Block Diagram

SCM-014

Table 7-8 describes the CONTROL.CONTROL_PBIAS_LITE bit controls for the PBIAS and the extended-drain I/O cells.

Table 7-8. PBIAS Cell and Extended-Drain I/O Pin CONTROL_PBIAS_LITE Bit Controls

Control Signals for PBIAS0 and/or Associated Extended-Drain I/O Cell	Control Signals for PBIAS1 and/or Associated Extended-Drain I/O Cell	Description
PBIASLITEPWRDNZ0	PBIASLITEPWRDNZ1	The PBIASLITEPWRDNZ0 bit is used to simultaneously protect the PBIAS0 cell and its associated (MMC/SD/SDIO1) extended-drain I/O cell when the MMC1_VDD5 power supply voltage is not stable. The PBIASLITEPWRDNZ1 bit is used to simultaneously protect the PBIAS1 cell and its associated extended-drain I/O cell when the SIM_VDD5 power supply voltage is not stable. Software must keep the PBIASLITEPWRDNZ0/PBIASLITEPWRDNZ1 signal to 0b0 whenever the MMC1_VDD5/SIM_VDD5 signal is ramping. When this bit is at 0, the PAD is floating.
PBIASLITEVMODE0	PBIASLITEVMODE1	Controls the MMC1_VDD5 (for PBIAS0) or SIM_VDD5 (for PBIAS1) voltage level. The default state of this bit is HIGH, indicating that the voltage level is 3.0 V.

Table 7-8. PBIAS Cell and Extended-Drain I/O Pin CONTROL_PBIAS_LITE Bit Controls (continued)

Control Signals for PBIAS0 and/or Associated Extended-Drain I/O Cell	Control Signals for PBIAS1 and/or Associated Extended-Drain I/O Cell	Description
PBIASLITESUPPLYHIGH0	PBIASLITESUPPLYHIGH1	Describes whether the MMC1_VDDS (for PBIAS0) or SIM_VDDS (for PBIAS1) supply is 3.0 V or 1.8 V
PBIASPEEDCTRL0	PBIASPEEDCTRL1	Controls I/O cell speed
PBIASLITEVMODEERROR	PBIASLITEVMODEERROR1	Indicates whether the software-programmed VMODE level matches the SUPPLY_HI output signal
PBIAS0_ERROR	PBIAS1_ERROR	Determines whether the software-programmed PBIASLITEVMODEx level matches the PBIASLITESUPPLYHIGHx. This signal is generated only when PBIASLITEVMODEENx is HIGH.

Table 7-9 lists the power supplies for the PBIAS and the extended-drain I/O cells.

Table 7-9. Power Supplies

Name	Description
VDD2	Core voltage supply
MMC1_VDDS or SIM_VDDS (vdds_mmc1 or vdds_sim power pins of the device)	I/O supply voltage nominal 1.8 V/ 3.0 V
VDDS	1.8-V supply for the input buffer

7.4.5.1 PBIAS Cells

The PBIAS0 and PBIAS1 cells provide a bias for the extended-drain I/O cells used with high voltage for the MMC/SD/SDIO1 interface. The PBIAS cells provide a voltage reference (PBIAS voltage) for biasing extended drain in the MMC/SD/SDIO1 I/O cells.

NOTE: With the appropriate configuration of the PBIAS cell, gpio120 through gpio129 I/Os (MuxMode = 0x4) can operate in 3-V mode.

In addition to generating the bias voltage, the PBIAS cells can detect the value (1.8 V or 3.0 V) of the supply voltage (MMC1_VDDS or SIM_VDDS) and update, with its status, the PBIASLITESUPPLYHIGH0 or PBIASLITESUPPLYHIGH1 bit.

CAUTION

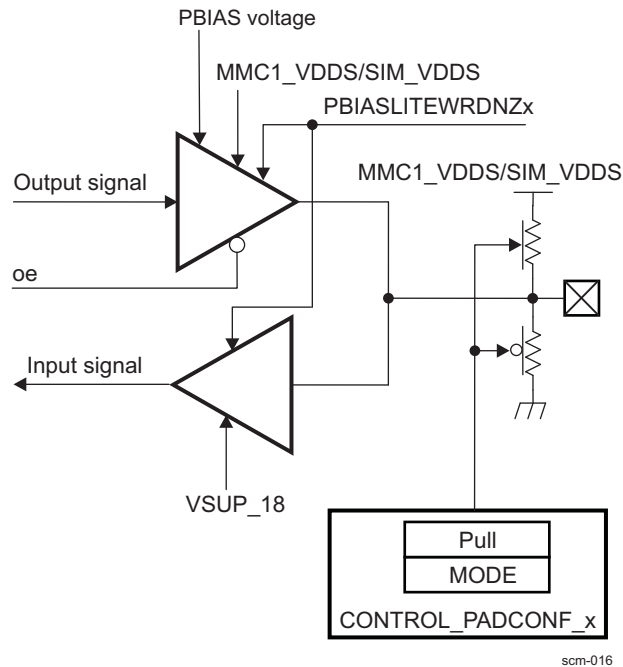

The PBIAS cells let the MMC/SD/SDIO1 peripheral support 1.8-V and 3.0-V voltages. A PBIAS cell is not a part of the MMC/SD/SDIO1 peripheral, but a part of the device I/O to which the MMC/SD/SDIO1 peripheral is internally connected. These device I/Os are not exclusive to the MMC/SD/SDIO1 peripheral; through I/O multiplexing they can be connected to other internal signals. It is necessary to configure the PBIAS to enable the I/Os, regardless of how I/O multiplexing is configured for these device I/Os. In other words, independently of which signal is internally connected to a device I/O powered by MMC1_VDDS or SIM_VDDS, the PBIAS must be configured.

7.4.5.2 Extended-Drain I/Os

On the device, the following extended-drain I/Os are used by I/Os from the MMC/SD/SDIO1:

- mmc1_clk
- mmc1_cmd
- mmc1_dati (where i = 0 to 7)

Figure 7-13 describes the extended-drain I/O cell.

Figure 7-13. Extended-Drain I/O

The extended-drain I/O cells have the following I/O signals:

- Output signal, input signal, and oe, which comes from the selected I/O module with the correct MODE field CONTROL_PADCONF_X configuration.

NOTE: MMC/SD/SDIO1 extended-drain I/Os are muxed I/Os with mode and pull-up/pull-down configurations programmable in the SCM.

- The PBIAS voltage is a voltage reference for biasing the extended-drain in the MMC/SD/SDIO1/I/O cells.
- The PBIASLITEPWRDNZ0 or PBIASLITEPWRDNZ1 bits are used to protect the two I/O cells when the voltage of MMC1_VDD or SIM_VDD, respectively, is not stable.

CAUTION

Software must keep the PWRDNZ-related signals to 0b0 when the MMC1_VDD or SIM_VDD signal is ramping up/down or changing. When PBIASLITEPWRDNZ0 or PBIASLITEPWRDNZ1 is 0, the PAD is floating (the PAD may not reflect the state of the output signal, and the input signal may not reflect the state of the PAD).

- The PBIASPEEDCTRL0 or PBIASPEEDCTRL1 bits control the speed of I/O cells and can be used to reduce dynamic current if fast rise/fall times are not required.
- The PBIASLITESUPPLYHIGH0 bit is a status bit on the MMC1_VDD value and is used to inform the PBIAS0 cell about the value of the MMC1_VDD signal.
- The PBIASLITESUPPLYHIGH1 bit is a status bit on the SIM_VDD value and is used to inform the PBIAS1 cell about the value of the SIM_VDD signal.

For more information about the software configurations of the extended-drain I/Os and PBIAS cells, see [Section 7.5.2, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

7.4.6 Band Gap Voltage and Temperature Sensor

The device supplies a voltage reference and a temperature sensor feature which are gathered in the band gap voltage and temperature sensor (BGAPTS) module. The band gap provides current and voltage reference for its internal circuits and also to other analog IP blocks. The A/D converter (ADC) produces an output value that is proportional to the silicon temperature.

Main features of the BGAPTS module are:

- A constant voltage reference output: 0.5 V
- Four constant current reference outputs of 1µA
- Analog supply is a nominal 1.8 V.
- Small A/D converter with 7-bit digital output
- OFF mode compatible
- Thermal shutdown comparator output

The band gap and the temperature sensor are software-controlled by bits located in the CONTROL.CONTROL_TEMP_SENSOR register of the SCM. See Section 7.4.7.6, Register Descriptions, for the description of this register.

Figure 7-14 shows the functional block diagram of the band gap and the temperature sensor module.

Figure 7-14. Functional Block Diagram

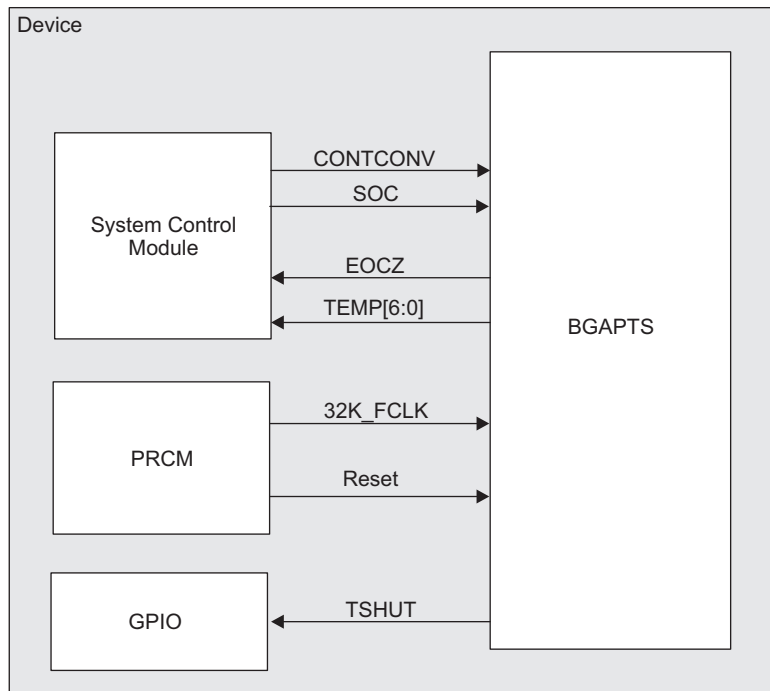

Table 7-10 describes the input and output signals for the band gap and the temperature sensor.

Table 7-10. Band Gap Voltage and Temperature Sensor Signals Description

Pin	I/O ⁽¹⁾	Description
SOC	I	Start Of Conversion signal. A transition to high starts a new ADC conversion cycle.
EOCZ	I	End of Conversion signal. When low, the signal indicates that the value of TEMP[6:0] is valid.
TEMP[6:0]	O	Temperature data from the temperature sensor. This value is valid when EOCZ is low.
CONTCONV	I	Configures the temperature sensor in continuous conversion mode. 0 – ADC single conversion mode 1 – ADC continuous conversion mode

⁽¹⁾ I=Input, O=Output

Table 7-10. Band Gap Voltage and Temperature Sensor Signals Description (continued)

Pin	I/O ⁽¹⁾	Description
TSHUT	O	Thermal shutdown comparator output. The signal is low during normal operation and goes high during a thermal shutdown event.
RESET	I	When low the temperature sensor is in RESET mode. This signal needs to be LOW when OFFMODE is HIGH.
32K_FCLK	I	32-kHz functional clock from the CORE domain used by the temperature sensor during temperature conversion.

All the configuration signals are available through the `CONTROL.CONTROL_TEMP_SENSOR` register.

NOTE: BGAPTS 32K_FCLK is used only for the temperature sensor. When ADC is not converting, this clock can be switched OFF (32K_FCLK = 0). In this case, TEMP[6:0] retains the temperature code obtained at the previous conversion.

7.4.6.1 Band Gap Voltage Reference

The band gap voltage reference feature provides several constant voltage and current references for its internal circuits, but also for other analog modules.

The voltage reference signal is a 0.5-V output which is internally used by the module and that is exported for external modules or for tests.

The current reference signals consist in four lines that supply each a 1- μ A current with a 1.8-V voltage. These lines can be used to bias other modules.

7.4.6.2 Temperature Sensor

The temperature sensor feature is used to convert the temperature of the device into a decimal value coded on 7 bits. An internal ADC (realized with a resistor array) is used for conversion. The recommended operating temperatures have to be in the -40 to 125°C for standard conversion, and can go up to 160°C when using the thermal shutdown comparator output (TSHUT signal). This signal indicates a too high temperature of the device. This signal is internally connected to a GPI/O pin. See [Chapter 24, General-Purpose Interface](#), for more information.

The temperature sensor offers two operating modes: a single conversion mode and a continuous conversion mode.

7.4.6.2.1 Single Conversion Mode (CONTCONV = 0)

When the ADC is idle (EOCZ = 0), it is possible to ask for a single temperature conversion. To initiate a new conversion, the start of conversion (SOC) signal should be asserted and maintained high until the end of conversion (EOCZ) signal goes high, after which the SOC should be made low by writing 0 to the `CONTROL.CONTROL_TEMP_SENSOR[8]` SOC bit. Conversion completion is indicated by a negative edge on EOCZ (`CONTROL.CONTROL_TEMP_SENSOR[7]` EOCZ bit).

The timing sequence for a single temperature conversion is shown in [Figure 7-15](#).

Figure 7-15. Single Conversion Mode (CONTCONV = 0)

7.4.6.2.2 Continuous Conversion Mode (CONTCONV = 1)

When the ADC is idle (EOCZ = 0), it is possible to ask for a single temperature conversion. To initiate a new conversion, the SOC signal should be asserted and maintained high until the EOCZ signal goes high, after which the SOC should be made low by writing 0 to the CONTROL.CONTROL_TEMP_SENSOR[8] SOC bit. The ADC starts converting continuously, and when a conversion is complete, data is written to the CONTROL.CONTROL_TEMP_SENSOR[6:0] TEMP bits and EOCZ goes low after four clock cycles.

The timing sequence for a continuous temperature conversion is shown in Figure 7-16.

Figure 7-16. Continuous Conversion Mode (CONTCONV = 1)

7.4.6.2.3 ADC Codes Versus Temperature

Table 7-11 gives the temperature range corresponding to each value of the CONTROL.CONTROL_SENSOR[6:0] TEMP bits.

Table 7-11. ADC Codes Versus Temperature

ADC Code	Temperature °C		ADC Code	Temperature °C		ADC Code	Temperature °C		ADC Code	Temperature °C	
	From	To		From	To		From	To		From	To
0	-40	-40	32	-0.7	0.8	64	44.9	46.3	96	89.3	90.6

7.4.7 Functional Register Description

7.4.7.1 Static Device Configuration Registers

Table 7-12 describes the static device configuration registers.

Table 7-12. Static Device Configuration Registers

Physical Address	Register Name	Description	Access
0x4800 2274	CONTROL_DEVCONF0	Module dedicated configurations	R/W
0x4800 22D8	CONTROL_DEVCONF1	Module dedicated configurations	R/W

These registers allow the static configuration of device modules such as USB, McBSP, and I²C. For example, they allow selecting external or internal clocks for McBSP modules.

7.4.7.2 Control CSIRXFE Register

Table 7-13 describes the [CONTROL_CSIRXFE](#) register, which controls some CSIRXFE analog cell settings. The CSIRXFE analog cell is used in the interface between a digital camera module and a mobile engine phone.

Table 7-13. Control CSIRXFE Register

Physical Address	Register Name	Description	Access
0x4800 22DC	CONTROL_CSIRXFE	Controls settings for CS1b interface pin	R/W

7.4.7.3 MPU and/or DSP (IVA2.2) MSuspend Configuration Registers

Table 7-14 describes the MPU and/or DSP (IVA2.2) MSuspend configuration registers.

Table 7-14. MSuspendMux Control Registers

Physical Address	Register Name	Description	Access
0x4800 2290	CONTROL_MSUSPENDMUX_0	Control the use of MSuspend signals at module level	R/W
0x4800 2294	CONTROL_MSUSPENDMUX_1		R/W
0x4800 2298	CONTROL_MSUSPENDMUX_2		R/W
0x4800 229C	CONTROL_MSUSPENDMUX_3		R/W
0x4800 22A0	CONTROL_MSUSPENDMUX_4		R/W
0x4800 22A4	CONTROL_MSUSPENDMUX_5		R/W

These registers provide an entry for each module that must consider the MSuspend signals from the processors (MPU and/or DSP). For each module, the sensitivity to the MSuspend signals is defined within five possibilities (coded using 3 bits):

- 0b000: No sensitivity; no MSuspend signal reaches the module.
- 0b001: Sensitivity to the MPU MSuspend signal (the DSP signal is ignored)
- 0b010: Sensitivity to the DSP MSuspend signal (the MPU signal is ignored)
- 0b011: Sensitivity to the logical ORed MPU and DSP MSuspend signals
- 0b100: Sensitivity to the logical ANDed MPU and DSP MSuspend signals
- Other values: No sensitivity; no MSuspend signal reaches the module.

The logic used to combine the MSuspend signals from the processors is implemented within the SCM. MSuspend signals are active low.

CAUTION

Use care when using combined sensitivity settings (ANDing or ORing DSP and MPU MSuspend signals).

ORing the DSP and MPU MSuspend signals creates a situation where the module is suspended when at least one processor is under debug; therefore, when one processor is halted, stepping within the code of the other one does not change the module suspended state.

Not all modules use the MSUSPEND signal. See the TRM chapter for each module to determine whether the module supports the MSUSPEND signal.

All MSUSPEND signals coming out of the MPU and DSP are resynchronized within the SCM by using the control module interface clock.

7.4.7.4 IVA2.2 Boot Registers

[Table 7-15](#) describes the IVA2.2 boot registers.

Table 7-15. IVA2.2 Boot Registers

Physical Address	Register Name	Description	Access
0x4800 2400	CONTROL_IVA2_BOOTADDR	IVA2.2 boot loader address register	R/W
0x4800 2404	CONTROL_IVA2_BOOTMOD	IVA2.2 boot mode register	R/W

The [CONTROL.CONTROL_IVA2_BOOTADDR](#) register defines the physical address for the IVA2 boot loader and drives the IVA2_BOOTADDR[21:0] signals out from the control block to the IVA2 subsystem.

The [CONTROL.CONTROL_IVA2_BOOTMOD](#) register defines the IVA2 boot mode and drives the IVA2_BOOTMOD[3:0] signals out from the control block to the IVA2.2 subsystem. Based on the value of IVA2_BOOTMOD[3:0], the ROM boot loader executes different boot modes of IVA2.2.

[Table 7-16](#) lists the IVA2.2 boot modes.

Table 7-16. IVA2.2 Boot Modes

IVA2_BOOTMOD[3:0] Value	Meaning
0x0	Direct boot: The ROM loader is not executed. Instead, IVA2.2 directly starts executing the bootstrap at the address contained in the CONTROL_IVA2_BOOTADDR register.
0x1	Idle boot: The boot loader executes the IDLE instruction.
0x2	Wait in self-loop boot: The boot loader puts IVA2.2 in a self-loop.
0x3	User-defined bootstrap mode: The boot loader copies the boot strap into internal memory and branches to it.
0x4	The boot loader executes the default context restore code, which is part of the ROM boot loader.

For further information, see [Chapter 14, IVA2.2 Subsystem](#).

7.4.7.5 PBIAS LITE Control Register

[Table 7-17](#) describes the [CONTROL.CONTROL_PBIAS_LITE](#) register, which controls some settings of PBIAS LITE cells for MMC/SD/SDI/O interface.

Table 7-17. PBIAS Control Register

Physical Address	Register Name	Description	Access
0x4800 2520	CONTROL_PBIAS_LITE	Control settings for PBIAS and extended-drain I/O cells	R/W

For more information about the PBIAS cells, see [Section 7.4.5, Extended-Drain I/O Pin and PBIAS Cell](#).

7.4.7.6 Temperature Sensor Control Register

[Table 7-18](#) describes the [CONTROL.CONTROL_TEMP_SENSOR](#) register, which controls the temperature sensor.

Table 7-18. Temperature Sensor Register

Physical Address	Register Name	Description	Access
0x4800 2524	CONTROL_TEMP_SENSOR	Temperature sensor control register	R/W

7.4.7.7 CSI Reciever Control Register

[Table 7-19](#) describes the [CONTROL.CONTROL_CSI](#) register, which controls the CS1b receiver trimming override.

Table 7-19. CSI Receiver Control Register

Physical Address	Register Name	Description	Access
0x4800 2530	CONTROL_CSI	CS1b receiver trimming override	R/W

7.4.8 Protection Status Registers

[Table 7-20](#) lists the status registers.

Table 7-20. Protection Status Registers

Physical Address	Register Name	Description	Access
0x4800 22E4	CONTROL_PROT_ERR_STATUS	Protection error status register	Public (R)
0x4800 22E8	CONTROL_PROT_ERR_STATUS_DEBUG	Protection error status register debug	Public (R)

These registers do not depend on the device type.

The CONTROL.[CONTROL_PROT_ERR_STATUS](#), and CONTROL.[CONTROL_PROT_ERR_STATUS_DEBUG](#) registers can be read in public mode, but can not be written.

These bits are cleared when the L3 and L4 firewall embedded error log registers are cleared. All bits in these registers reflect device internal events related to the device protection.

On a specific event (signal rising edge), the corresponding bit is set. On a rising edge, the input signal must stay high for at least two interface clocks periods to be recognized. The software must clear each bit after reviewing the events.

When a protection violation occurs, the following bits are set :

- In application mode
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [00] = OCM-ROM protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [01] = OCM-RAM protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [02] = GPMC protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [04] = SMS protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [06] = IVA2.2 protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [07] = L4-Core protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [12] = L3 RT protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [15] = D2D protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [16] = L4-Peri protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS](#) [17] = L4-Emu protection violation
- In debug mode
 - CONTROL.[CONTROL_PROT_ERR_STATUS_DEBUG](#) [00] = OCM-ROM protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS_DEBUG](#) [01] = OCM-RAM protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS_DEBUG](#) [02] = GPMC protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS_DEBUG](#) [03] = SMS protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS_DEBUG](#) [06] = IVA2.2 protection violation
 - CONTROL.[CONTROL_PROT_ERR_STATUS_DEBUG](#) [12] = L3 RT protection violation

For more information, see [Chapter 5, Interconnect](#).

7.4.9 SDRG Registers

[Table 7-21](#) lists the SDRAM controller (SDRC) registers, which export reset values to the SDRG registers.

Table 7-21. SDRG Registers

Physical Address	Register Name	Description	Access
0x4800 2460	CONTROL_SDRG_SHARING	SDRC sharing configuration	R/W
0x4800 2464	CONTROL_SDRG_MCFG0	SDRC configuration register 0	R/W
0x4800 2468	CONTROL_SDRG_MCFG1	SDRC configuration register 1	R/W

At reset, the following occur:

- CONTROL.[CONTROL_SDRG_SHARING](#)[30:0] copies into SDRC.SDRG_SHARING[30:0].
- CONTROL.[CONTROL_SDRG_MCFG0](#)[30:0] copies into SDRC.SDRG_MCFG_0[30:0].
- CONTROL.[CONTROL_SDRG_MCFG1](#)[30:0] copies into SDRC.SDRG_MCFG_1[30:0].

When LOCK bit SDRC.SDRG_SHARING[30] is set, a copy of SDRC.SDRG_SHARING[30:0] is made into CONTROL.[CONTROL_SDRG_SHARING](#)[30:0].

When LOCK bit SDRC.SDRG_MCFG_0[30] is set, a copy of SDRC.SDRG_MCFG_0[30:0] is made into CONTROL.[CONTROL_SDRG_MCFG0](#)[30:0].

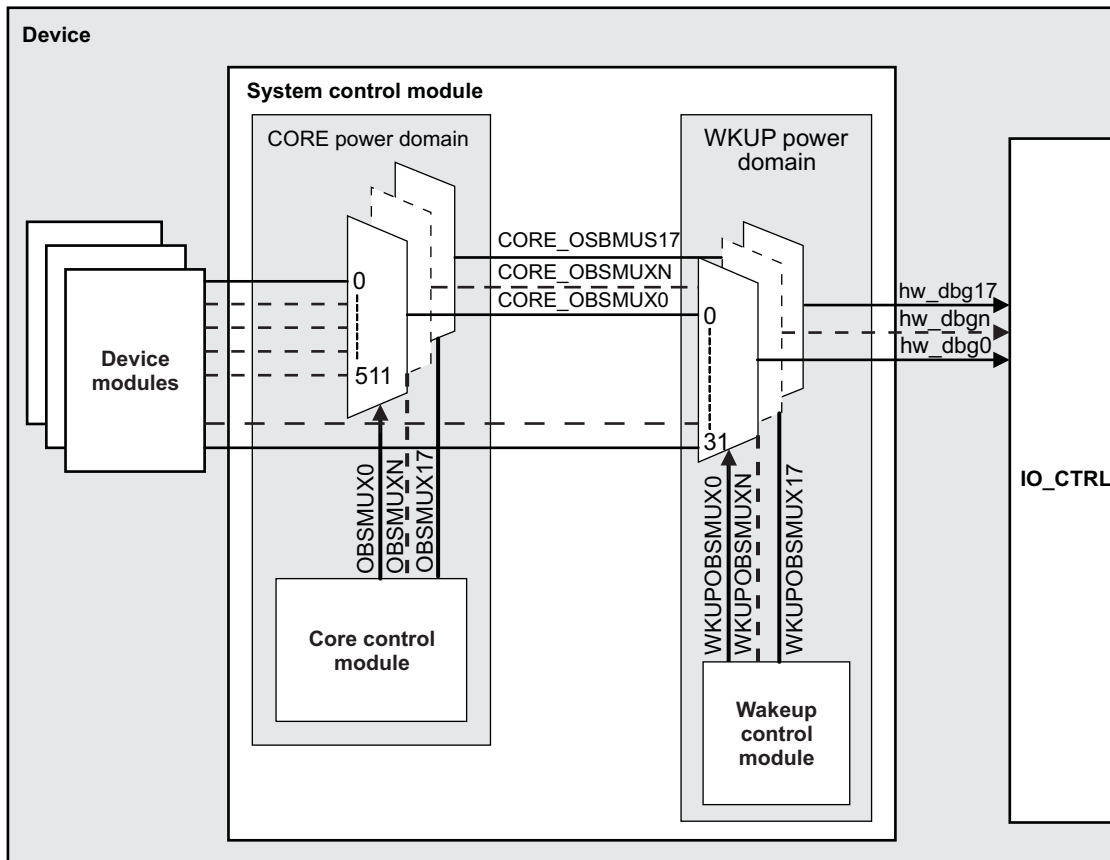

When LOCK bit SDRC.SDRG_MCFG_1[30] is set, a copy of SDRC.SDRG_MCFG_1[30:0] is made into CONTROL.[CONTROL_SDRG_MCFG1](#)[30:0].

7.4.10 Debug and Observability

7.4.10.1 Description

Figure 7-17 shows an overview of observability multiplexing, which minimizes the number of signals exchanged at the power domain boundary.

Figure 7-17. Overview of the Debug and Observability Register Functionality

108-017

Two layers of multiplexer are used to select the set of internal observable signals (PRCM signals, DMA requests, and interrupts) to be routed to the pins dedicated to the hardware debug.

The first layer is in the CORE power domain. It is controlled by the core control module registers and selects the set of internal signals from the CORE power domain to be routed. The second layer is in the WKUP power domain. It is controlled by the wake-up control module registers and selects the set of internal signals from the WKUP power domain.

The pads used for the hardware debug must be properly configured by selecting the hardware debug function (`hw_dbgN`) of the pad. To configure the pads, select mode 5 (0b101) in the MUXMODE bit field of the `CONTROL.CONTROL_PADCONF_CAM_x` register (only for `hw_dbg0` to `hw_dbg11`), or select mode 7 (0b111) in the MUXMODE bit field of the `CONTROL.CONTROL_PADCONF_ETK_x` register (for all `hw_dbgN`). Before selecting the CORE signals, the `WKUPOBSMUX` bit field of the `CONTROL.CONTROL_WKUP_DEBOBS_n` registers must be set to 0.

Table 7-22. Observability Registers

Physical Address	Register Name	Description	Access	
			Device Type	
			E/T/G	S/B
0x4800 2420	CONTROL_DEBOBS_0	Set and configure CORE observable signals 1 and 0	R/W	R
0x4800 2424	CONTROL_DEBOBS_1	Set and configure CORE observable signals 3 and 2	R/W	R
0x4800 2428	CONTROL_DEBOBS_2	Set and configure CORE observable signals 5 and 4	R/W	R
0x4800 242C	CONTROL_DEBOBS_3	Set and configure CORE observable signals 7 and 6	R/W	R
0x4800 2430	CONTROL_DEBOBS_4	Set and configure CORE observable signals 9 and 8	R/W	R
0x4800 2434	CONTROL_DEBOBS_5	Set and configure CORE observable signals 11 and 10	R/W	R
0x4800 2438	CONTROL_DEBOBS_6	Set and configure CORE observable signals 13 and 12	R/W	R
0x4800 243C	CONTROL_DEBOBS_7	Set and configure CORE observable signals 15 and 14	R/W	R
0x4800 2440	CONTROL_DEBOBS_8	Set and configure CORE observable signals 17 and 16	R/W	R
0x4800 2A68	CONTROL_WKUP_DEBOBS_0	Set and configure WKUP observable pins 3, 2, 1, 0	R/W	R
0x4800 2A6C	CONTROL_WKUP_DEBOBS_1	Set and configure WKUP observable pins 7, 6, 5, 4	R/W	R
0x4800 2A70	CONTROL_WKUP_DEBOBS_2	Set and configure WKUP observable pins 11, 10, 9, 8	R/W	R
0x4800 2A74	CONTROL_WKUP_DEBOBS_3	Set and configure WKUP observable pins 15, 14, 13, 12	R/W	R
0x4800 2A78	CONTROL_WKUP_DEBOBS_4	Set and configure WKUP observable pins 17, 16	R/W	R

The write capabilities of these registers differ according to the device type.

Perform the following steps to configure observability:

1. To configure the pads properly for hardware debug and observability, select the hardware debug (hw_dbg) function mode 5 in the MUXMODE bit field of the CONTROL.CONTROL_PADCONF_CAM_x or mode 7 in the MUXMODE bit field of the CONTROL.CONTROL_PADCONF_ETK_X registers.
2. For the observability pads, set the proper values of the WKUPOBSMUX field CONTROL.CONTROL_WKUP_DEBOBS_n. Up to 5 bits are used to select the signal set to be observed (0x00 selection sets the output to CORE_OSMUXn signal). For more information, see the description of each register in [Section 7.4.10.2, Observability Tables](#).
3. To observe the CORE_OBSMUXn signals from the first layer of the multiplexer, set the WKUPOBSMUX field CONTROL.CONTROL_WKUP_DEBOBS_n to 0x00, and then set the proper values of the OBSMUX field CONTROL.CONTROL_DEBOBS_n. A maximum of 7 bits is used to select the signal set to be observed (0b0000000 selection sets the output to 0).

For more information, see the description of each register in [Section 7.4.10.2, Observability Tables](#).

The observability feature of the CONTROL.CONTROL_DEBOBS_n registers can be gated by setting the CONTROL.CONTROL_PROT_CTRL[5] OBSERVABILITYDISABLE bit to 0x1. If the user configures the pads for hardware observability, selected to observe CORE_OBSMUXn signals and set to OBSERVABILITYDISABLE = 0x1, the corresponding hw_dbg outputs are set to 0. Observability of the CORE_OBSMUXn signal is enabled by default (POR value OBSERVABILITYDISABLE = 0x0). Because the type of this bit is read/one-change only (R/OCO), the CORE_OBSMUXn signals can be gated only once after a POR event.

The observability feature of the CONTROL.CONTROL_WKUP_DEBOBS_n registers can be gated using the WKUPOBSERVABILITYDISABLE bit CONTROL.CONTROL_WKUP_DEBOBS_4[31]. If this bit is set, and the pads are configured for hardware observability of the WKUP mux set signals, the corresponding hw_dbg outputs are set to 0. Observability of the WKUP mux set signals is enabled by default (POR value WKUPOBSERVABILITYDISABLE = 0x0). Because the type of this bit is read/one-change only (R/OCO), the WKUP mux set signals can be gated only once after a POR event.

NOTE: The OBSERVABILITYDISABLE and WKUPOBSERVABILITYDISABLE bits are of the type (R/OCO) to which the following rules apply:

- Write actions that do not change the bit reset value are not considered.
- The first write action that changes the bit reset value is considered, but any subsequent write actions are ignored. No more write actions are effective until the next POR.

NOTE: To disable observability for all hw_dbg I/Os (that is, drive the external observability outputs to 0), observability of the CORE and WKUP domains must be disabled. Disabling only wkup_observability is not sufficient.

7.4.10.2 Observability Tables

Table 7-23 through Table 7-58 define the mapped internal signals for each OBSMUX and WKUPOBSMUX value.

Table 7-23. Internal Signals Multiplexed on OBSMUX0

Out Signal Name	Muxed Signal Name	OBSMUX0 Field CONTROL.CONTROL_WKUP_DEBOBS_0 [22:16] (dec)	Description	High State	Low State

hw_dbg9 ⁽¹⁾	CORE_OBSMUX9	0	Signal multiplexed by OBSMUX9.	-	-
	PRCM_USBTLL_SAR_FCLK	1	Functional clock of USBTLL.	-	-
	PRCM_IVA2_RST2	2	Reset signal 2 for IVA2.	Reset not active	Reset active
	PRCM_EMU_RST	3	Reset signal for EMU domain.	Reset not active	Reset active
	PRCM_VDD2_VOLCON_RST	4	Reset signal for VDD2_VOLCON.	Reset not active	Reset active
	PRCM_COREL3_domainWakeup	5	Indicates that a wake-up condition is detected for the COREL3 domain.	Conditions reached	Conditions not reached
	PRCM_vdd1_domain_is_good	6	Indicates whether the VDD1 power domain is stable.	Power is stable	Power is not stable
	PRCM_vdd1_domain_is_sleep	7	Indicates to the global Power Manager FSM that the VDD1 domain power state is SLEEP.	State is SLEEP	State is not SLEEP
	PRCM_vdd4_domain_is_off	8	Indicates to the global Power Manager FSM that the VDD4 domain power state is OFF.	State is OFF	State is not OFF
	PRCM_Device_wakeup	9	When a wakeup transition occurs, this signal (sent by the last pad) indicates that all pads have been waken-up.	All pads have been waken-up	Some pads are in SLEEP mode
	PRCM_MPU_POWER_ON	10	MPU switch command for power-on.	Power is ON	Power is OFF
	PRCM_IVA2_POWER_GOOD[0]	11	Indicates whether the IVA2 power switches status (bit 0).	Power is stable	Power is not stable
	PRCM_IVA2_SRAMRETONIN[2]	12	SRAM retention on signal to IVA2 power domain (bit 2).	Retention is ON	Retention is OFF
	PRCM_CORE_SRAMAONIN[3]	13	SRAM array power control input (bit 3) for CORE power domain.	Array is powered	Array is not powered
	PRCM_CORE_SRAMRETTGOODOUT[3]	14	Indicates whether the SRAM retention banks in the CORE domain are stable (bit 3).	Power is stable	Power is not stable
	PRCM_DSS_POWER_ISO	15	PM command for DSS domain isolation.	Isolation is ON	Isolation is OFF
	PRCM_CAM_SRAMRETTGOODOUT[0]	16	Indicates whether the SRAM retention banks in the CAM domain are stable (bit 0).	Power is stable	Power is not stable
	PRCM_DPLL3_POWER_ISO	17	PM command for DPLL3 domain isolation.	Isolation is ON	Isolation is OFF
	PRCM_PER_SRAMRETTGOODOUT[0]	18	Indicates whether the SRAM retention banks in the PER domain are stable (bit 0).	Power is stable	Power is not stable
	PRCM_USBHOST_START_SAVE	19	Context Save Start Control.	Started	Not started
PRCM_USBTLL_SWAKEUP	20	USBTLL asserts this signal to initiate a transition to WAKEUP mode.	Transition initiated	Wakeup conditions not reached	
Reserved	(31:21)	-	-	-

7.4.11 Electromagnetic Interference Reduction for Clocking Generation (Spreading)

7.4.11.1 Overview

There are two major forms of digital signals: digital-data and digital-clock (CLK). Digital signals are the principal signal form in today's digital electronic products.

- A digital-data signal can be viewed as a sequence of pulses with different pulse widths
- A clock (CLK) signal is usually a string of rectangular pulses with the same pulse width

In the case of a clock, the generated signal has a predetermined frequency. Electromagnetic radiations such as radio frequency emissions are also generated from the constant frequency clock signals and their harmonics. Unfortunately, a problem exists with some devices such as communication devices for example in that the system clock generates unwanted spurious signals that interfere with the decoding of information from received signals by a receiver of the communication device. Note that data periodicity also causes interference.

This periodicity generates a significant power peak at the selected frequency, which in turn causes an EMI disturbance to the environment.

The harmonics of the generated signal system clock radiates in the other modules of the device, and the spurious energy can be enough to cause enough interference, which results in performance degradation (in the form of high bit error rates in case of a wireless communication interface for example).

In order to reduce the power peaks (and thus the energy of the electromagnetic noise generated for a specific frequency), an internal frequency modulation of the DPLL is used to distribute the energy to many different frequencies, thus reducing the power peaks.

This frequency modulation feature is directly integrated in some DPLLs of the device. The DPLLs that support this additional feature are called DPLL-D in the following.

Figure 7-18 shows a diagram of a DPLL that supports the EMI reduction feature.

Figure 7-18. DPLL With EMI Reduction Feature

108-033

The additional features of the DPLL compliant with EMI reduction are:

- EMI reduction using triangular frequency modulation, also called spread spectrum clocking (SSC).

7.4.11.2 Integration

The DPLLs/domains of the devices that support the EMI reduction feature are:

- DSS DPLL (DSI DPLL)
- CORE domain DPLL (DPLL3)
- PER domain DPLL (DPLL4)
- USBHOST DPLL (DPLL5)

Figure 7-19 shows the four DPLL-D integration in the device.

Figure 7-19. DPLL-D Integration

The control of the DPLL is done by the PRCM and the SCM:

- The PRCM controls the clocking generation of the DPLL. For more information, see [Chapter 4, Power, Reset, and Clock Management](#).
- The SCM contains all necessary bits that controls the EMI reduction feature (SSC).

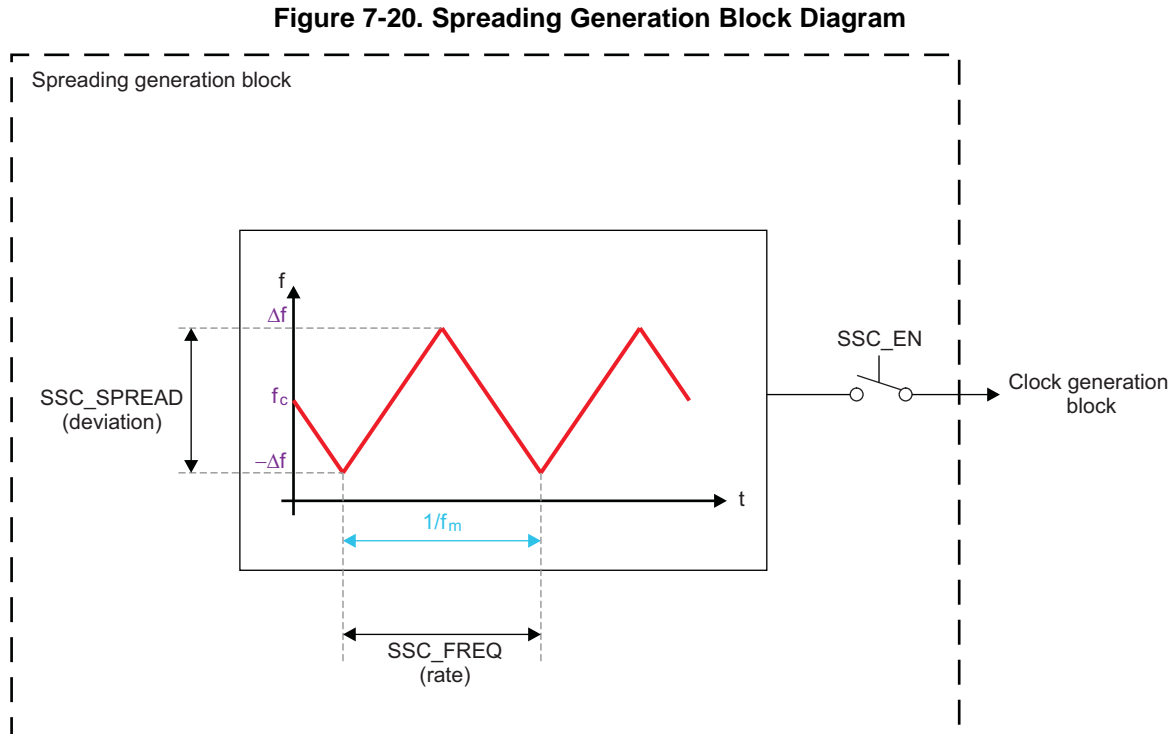

7.4.11.2.1 Clocking, Reset, and Power-Management Scheme

See [Chapter 4, Power, Reset, and Clock Management](#).

7.4.11.3 Functional Description

7.4.11.3.1 Spreading Generation Block

Figure 7-20 is a diagram of the spreading generation block.

108-035

NOTE: Δf is the deviation from the center frequency. The total spreading deviation is equal to twice Δf .

f_c is the original clock frequency.

f_m is the spreading frequency.

This additional block generates the required waveform used to reduce EMI. This waveform is then modulated with the initial signal to add some controlled deviation in the clock signal frequency, which spreads the energy of the clock and its harmonics into a band of frequencies, and then reduces the electromagnetic interferences.

The SSC_SPREAD value handles the deviation (amplitude) of the generated signal from the original signal. It is controlled by the CONTROL.CONTROL_XXX_DPLL_SPREADING[3:2] XXX_SPREADING_AMPLITUDE bit field of the corresponding registers (where XXX is the name of the concerned DPLLs). This register contains only a spreading ratio K , which is equal to $\Delta f / f_m$.

The SSC_FREQ value controls the rate of the generated signal. It is controlled by the CONTROL.CONTROL_XXX_DPLL_SPREADING[1:0] XXX_SPREADING_RATE bit field of the corresponding registers (where XXX is the name of the concerned DPLLs).

The SSC_EN signal enables/disables the frequency modulation feature of the DPLL. It is controlled by the CONTROL.CONTROL_XXX_DPLL_SPREADING[4] XXX_SPREADING_ENABLE bit field of the corresponding registers (where XXX is the name of the concerned DPLLs).

In any case, the frequency modulation is programmed in the SCM and does not generally need to be changed in real time.

7.4.11.3.2 Spread Spectrum Clocking

7.4.11.3.2.1 Definition

The aim of SSC is to add a variation in the frequency of an original clock, which spreads the generated interferences over a larger band of frequency.

In theory, SSC means that the clock signal is varied around the desired frequency. For example, for a 1-GHz clock, the frequency might be 999.5 MHz at one moment and 1.0005 GHz at another. Doing this constantly causes the power of the tone to be spread out more over a broader band of tight frequencies (centered at the desired tone). To realize this constant variation on the original signal, a modulation with an additional signal (called spreading waveform) is realized.

Creating an SSC by spreading the initial clock frequency is done by defining the following parameters:

- The spreading frequency (deviation), which is the ratio of the range of spreading frequency over the original clock frequency
- The modulation rate (f_m), which is used to determine the clock-frequency spreading-cycling rate and is the time during which the generated clock frequency varies through Δf and returns to the original frequency
- The modulation waveform, which describes the variation curve in terms of time

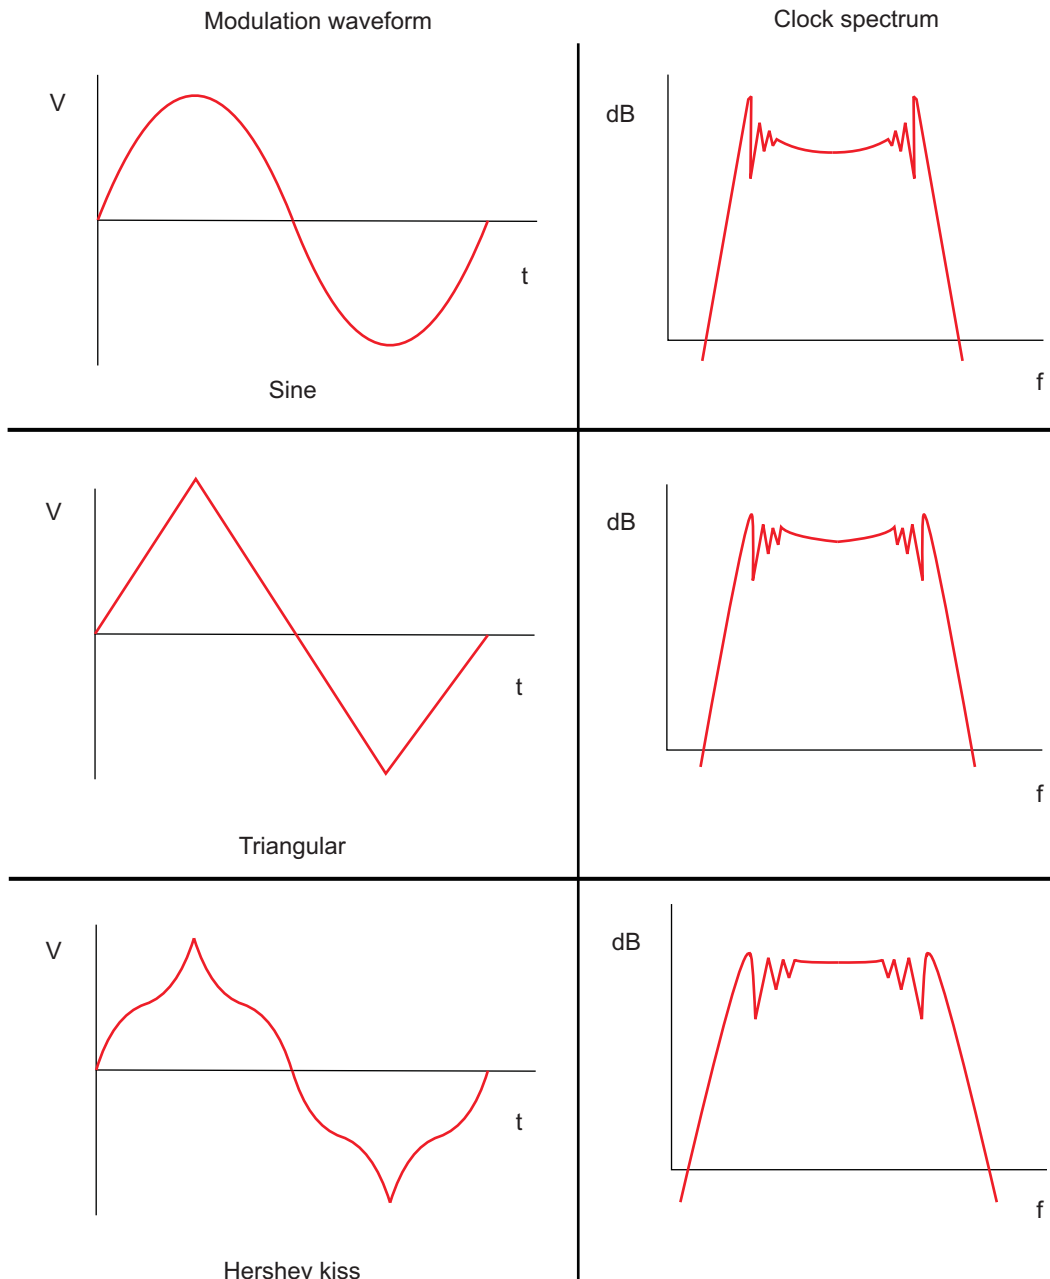

The spectral power reduction in the DPLL clocks is dependent on the modulation index (K), which is a ratio of spreading frequency calculated from the frequency deviation (Δf) and the modulation rate (f_m).

7.4.11.3.2.2 The Modulation Waveforms

The shape (profile) of the generated clock signal depends on the modulation waveform that is used during the frequency modulation. Several profiles can be used, according to the desired shaping for the energy spreading.

[Figure 7-21](#) shows three examples of modulation waveforms and the spectrum of the corresponding modulated clock signal.

Figure 7-21. Modulation Profiles

108-036

The triangular wave gives a relatively flat spectrum and is also easy to generate. The triangular waveform is used by the DPLL-D.

7.4.11.3.2.3 Effect on the Clock Signal

Figure 7-22 gives an example of the effect of a triangular spreading on a clock signal.

Figure 7-22. Effect of the SSC in Frequency

108-038

Figure 7-22 shows not only the power reduction of the main peak, but also the flatter aspect of the modulated signal. The minimum level of the second signal is higher than the minimum level of the first signal. This effect is normal and is due to the "noise" added for the modulation.

NOTE: The spreading technique "scatters" the energy of the peaks on the other frequencies, which reduces the power of the peaks but increases the global "noise" of the signal.

Figure 7-23 shows the effect of triangular spreading on a clock signal in the time domain.

Figure 7-23. Effect of the SSC in the Time Domain

108-039

7.4.11.3.2.4 Estimation of the EMI Reduction Level

Figure 7-24 shows the effect of spreading on a clock and its harmonics.

Figure 7-24. Peak Reduction Caused by Spreading

108-037

The electromagnetic interference reduction can be estimated with the following equation:

$$(1) \text{ Peak_power_reduction} = 10 * \log ((\text{Deviation} * f_c) / f_m)$$

With:

- Peak_power_reduction in dB
- Deviation in % of the initial clock frequency (f_c), equals $\Delta f / f_c$
- f_c is the original clock frequency, in MHz
- f_m is the spreading frequency, in MHz

According to equation (1), it is also possible to compute the deviation, and then Δf , for a required peak power reduction:

$$(2) \text{ Deviation} = (f_m / f_c) * 10^{(\text{Peak_power_reduction} / 10)}$$

Example:

For $f_c=400$ MHz, deviation =1% peak from f_c ($\Delta f = 4$ MHz) and $f_m=400$ kHz; the estimated peak power reduction is 10dB.

7.4.11.3.2.5 Bandwidth Calculation (Carson Bandwidth Rule)

The Carson bandwidth rule defines the approximate bandwidth requirements of communications system components for a carrier signal that is frequency-modulated by a continuous or broad spectrum of frequencies rather than a single frequency.

The Carson bandwidth rule is expressed by the relation $\text{CBR} = 2 * (\Delta f + f_m)$, where CBR is the bandwidth requirement, Δf is the peak frequency deviation, and f_m is the highest frequency in the modulating signal.

For example, an FM signal with a 5-kHz peak deviation and a maximum audio frequency of 3 kHz, would require an approximate bandwidth $2*(5+3) = 16$ kHz.

Theoretically, any FM signal has an infinite number of sidebands and hence an infinite bandwidth, but in practice all significant sideband energy (98% or more) is concentrated within the bandwidth defined by the Carson bandwidth rule.

7.4.11.3.3 Frequency Limitations

There are some limitations on the use of the spreading feature. Figure 7-25 shows the supported spreading frequency and deviation.

Figure 7-25. Supported Spreading Frequency and Deviation

		SPREADING_AMPLITUDE (bits [3:2])			
		00	01	10	11
		K			
		4	6	8	10
SPREADING_RATE (bits [1:0])	Min to Max rate (kHz)	Frequency deviation +/- kHz			
00	62.5 to 125	250 to 500	375 to 750	500 to 1000	625 to 1250
01	125 to 250	500 to 1000	750 to 1500	1000 to 2000	1250 to 2500
10	250 to 500	1000 to 2000	1500 to 3000	2000 to 4000	2500 to 5000
11	500 to 1000	2000 to 4000	3000 to 6000	4000 to 8000	5000 to 10000

 Not recommended. PLL jitter degradation and modulation amplitude not a linear function of FM.

108-040

Even if all the previous frequencies and deviations are supported by the DPLL-D, a range of "safe operating regions" is defined according to its impact on jitter.

Figure 7-26 shows the supported safe operating regions supported by the DPLL-D.

Figure 7-26. Supported Safe Operating Regions and Jitter Impact

CLKOUT FREQUENCY (25–900 MHz)	Recommended safe operating region				Max jitter impact in % due to spreading
400–900					+/- 1.25%
200–399					+/- 1.25%
100–199					+/- 1.25%
50–99					+/- 1.00%
25–49					+/- 2.00%

108-041

(1) See Figure 7-25 for the color coding.

7.4.11.4 Basic Programming Model

7.4.11.4.1 SSC Configuration

The configuration of the spreading feature is not mandatory when programming the DPLL. This feature is usually enabled when the DPLL clocks generate harmonics that can potentially interfere with the GSM carrier frequencies.

Once the "clock generation control" registers are configured, it is possible to configure the spreading on the clock signal.

The first thing to do is to calculate the deviation and/or the spreading rate according to the desired peak power reduction. In addition to this, it is necessary to have K (modulation index), which value is equal to $\Delta f / f_m$.

Then, the `XXX_SPREADING_AMPLITUDE` and `XXX_SPREADING_RATE` bit fields can be configured with the calculated values.

Finally, the spreading must be enabled using the `XXX_SPREADING_ENABLE` bit.

NOTE: It is necessary to configure the spreading on a clock carefully to avoid adding some noise on frequencies that are used by another module. For example, adding spreading on a clock to reduce noise on GSM frequencies can "move" the generated noise to the frequency of the memory controller and degrade its performance.

Example:

For $f_c=400$ MHz, deviation =1% peak from f_c ($\Delta f = 4$ MHz) and $f_m=400$ kHz; the estimated peak power reduction is 10dB. K is then equal to 10. The DPLL can be configured as follows:

- `XXX_SPREADING_RATE = 10` (250 to 500 KHz)
- `XXX_SPREADING_AMPLITUDE = 11` ($K = 10$)
- `XXX_SPREADING_ENABLE = 1`

The state of the modulation feature can be monitored with the `XXX_SPREADING_ENABLE_STATUS` bit of the corresponding register.

NOTE:

- To support the spreading feature, the DPLL bandwidth is restricted to a maximum of 70 kHz. This implies the reference clock frequency to be in range 0.75 MHz to 2.1 MHz, and the `XXX_DPLL_FREQSEL[3:0]` bit field to be in range of 0011 to 0111.
- The required Δf (frequency deviation) is targeted on the CLKOUT frequency and is achieved when M2 is programmed to 1. Otherwise, the frequency deviation is scaled down by the factor of the M2 value. However, this does not affect the deviation; therefore, the frequency change of harmonics at GSM frequencies is the same.
- The spread of modulation frequency within each range is due to an internal auto-ranging function and specific frequencies cannot be selected.
- The lowest range (62.5 to 125 kHz) must only be selected when the reference clock (PLL internal reference frequency) < 1.1 MHz is being used, to prevent the PLL feedback loop from canceling the modulation.

When deactivating the spreading (`XXX_SPREADING_ENABLE = 0`), the end-of-spreading is synchronous to the internal spreading cycle. Therefore, there is no residual average frequency error.

7.5 SCM Programming Model

7.5.1 Feature Settings

7.5.1.1 Force Pad Configuration MuxMode by High-Speed USB

The two pads `hsusb0_data0` and `hsusb0_data1` can force pad configuration MuxMode when the CARKITEN signal is generated:

- CARKITHSUSB0DATA0AUTOEN bit CONTROL.[CONTROL_DEVCONF1](#)[19]:
 - 0: The `hsusb0_data0` MuxMode signal is driven by MUXMODE1 bit CONTROL.[CONTROL_PADCONF_HSUSB0_NXT](#)[18:16].
 - 1: The `hsusb0_data0` MuxMode signal is forced to 0x2 when the CARKITEN signal is active.
- CARKITHSUSB0DATA1AUTOEN bit CONTROL.[CONTROL_DEVCONF1](#)[20]:
 - 0: The `hsusb0_data1` MuxMode signal is driven by MUXMODE0 bit CONTROL.[CONTROL_PADCONF_HSUSB0_DATA](#)[2:0].
 - 1: The `hsusb0_data1` MuxMode signal is forced to 0x2 when the CARKITEN signal is active.

NOTE: Associated pad configuration registers remain unchanged.

For more details on High-Speed USB, see [Chapter 23, High-Speed USB Controllers](#).

7.5.1.2 Video Driver

- TVOUTBYPASS bit CONTROL.[CONTROL_DEVCONF1](#)[18]:
 - 0b0: Dual 10-bit video DAC TV out bypass disable
 - 0b1: Dual 10-bit video DAC TV out bypass enable
- TVACEN bit CONTROL.[CONTROL_DEVCONF1](#)[11]:
 - 0b0: Enables dc coupling for TV output
 - 0b1: Enables ac coupling for TV output

For more details on video DACs, see [Chapter 15, Display Subsystem](#).

7.5.1.3 McBSP1 Internal Clock

The McBSP1 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP1.

- MCBSP1_FSR bit CONTROL.[CONTROL_DEVCONF0](#)[4]:
 - 0: FSR is from the pin `mcbasp1_fsr`.
 - 1: FSR is from the pin `mcbasp1_fsx`.
- MCBSP1_CLKR bit CONTROL.[CONTROL_DEVCONF0](#)[3]:
 - 0: CLKR is from the pin `mcbasp1_clkr`.
 - 1: CLKR is from the pin `mcbasp1_clkx`.
- MCBSP1_CLKS bit CONTROL.[CONTROL_DEVCONF0](#)[2]:
 - 0: CLKS is from the PRCM functional clock.
 - 1: CLKS is from the pin `mcbasp1_clks`.

For more details on McBSP, see [Chapter 21, McBSP](#).

7.5.1.4 McBSP2 Internal Clock

The McBSP2 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP2. The McBSP2 does not have `mcbasp2_clkr` and `mcbasp2_fsr` external pins. Clock input is from the `mcbasp2_clkx` pin; FSR input is from the `mcbasp2_fsx` pin.

- MCBSP2_CLKS register bit CONTROL.[CONTROL_DEVCONF0](#)[6]:
 - 0: Clock is from the PRCM functional clock.

1: Clock is from the external pin `mcbasp_clks`.

For more details on McBSP, see [Chapter 21, *McBSP*](#).

7.5.1.5 McBSP3 Internal Clock

The McBSP3 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP3. The McBSP3 does not have `mcbasp3_clkr` and `mcbasp3_fsr` external pins. Clock input is from the `mcbasp3_clkx` pin; FSR input is from the `mcbasp3_fsx` pin.

- MCBSP3_CLKS register bit CONTROL.[CONTROL_DEVCONF1\[0\]](#):
 - 0: Clock is from the PRCM functional clock.
 - 1: Clock is from the external pin `mcbasp_clks`.

For more details on McBSP, see [Chapter 21, *McBSP*](#).

7.5.1.6 McBSP4 Internal Clock

The McBSP4 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP4. The McBSP4 does not have `mcbasp4_clkr` and `mcbasp4_fsr` external pins. Clock input is from the `mcbasp4_clkx` pin; FSR input is from the `mcbasp4_fsx` pin.

- MCBSP4_CLKS register bit CONTROL.[CONTROL_DEVCONF1\[2\]](#):
 - 0: Clock is from the PRCM functional clock.
 - 1: Clock is from the external pin `mcbasp_clks`.

For more details on McBSP, see [Chapter 21, *McBSP*](#).

7.5.1.7 McBSP5 Internal Clock

The McBSP5 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP5. The McBSP5 does not have `mcbasp5_clkr` and `mcbasp5_fsr` external pins. Clock input is from the `mcbasp5_clkx` pin; FSR input is from the `mcbasp5_fsx` pin.

- MCBSP5_CLKS register bit CONTROL.[CONTROL_DEVCONF1\[4\]](#):
 - 0: Clock is from the PRCM functional clock.
 - 1: Clock is from the external pin `mcbasp_clks`.

For more details on McBSP, see [Chapter 21, *McBSP*](#).

7.5.1.8 MMC/SD/SDIO2 Module Input Clock Selection

- MMCSDIO2ADPCLKISEL bit CONTROL.[CONTROL_DEVCONF1\[6\]](#):
 - 0: Input clock is from the external pin.
 - 1: Internal loopback, module input clock is copied from the module output clock.

7.5.1.9 Setting Sensitivity on `sys_ndmareq[6:0]` Input Pins

The seven `sys_ndmareq0` to `sys_ndmareq6` input pins can be either level or edge sensitive.

- SENSDMAREQ0 bit CONTROL.[CONTROL_DEVCONF0\[0\]](#):
 - 0: Level sensitivity
 - 1: Edge sensitivity
- SENSDMAREQ1 bit CONTROL.[CONTROL_DEVCONF0\[1\]](#):
 - 0: Level sensitivity
 - 1: Edge sensitivity
- SENSDMAREQ2 bit CONTROL.[CONTROL_DEVCONF1\[7\]](#):
 - 0: Level sensitivity
 - 1: Edge sensitivity
- SENSDMAREQ3 bit CONTROL.[CONTROL_DEVCONF1\[8\]](#):
 - 0: Level sensitivity
 - 1: Edge sensitivity

- SENSDMAREQ4 bit CONTROL.[CONTROL_DEVCONF1](#)[21]:
0: Level sensitivity
1: Edge sensitivity
- SENSDMAREQ5 bit CONTROL.[CONTROL_DEVCONF1](#)[22]:
0: Level sensitivity
1: Edge sensitivity
- SENSDMAREQ6 bit CONTROL.[CONTROL_DEVCONF1](#)[23]:
0: Level sensitivity
1: Edge sensitivity

For more details on DMA, see [Chapter 9, DMA](#).

7.5.1.10 I²C I/O Internal Pull-up Enable

The I/O internal pull-up of I2C1, I2C2, and I2C3 can be enabled:

- I2C1HSMMASTER bit CONTROL.[CONTROL_DEVCONF1](#)[12]:
0: I2C1 I/O internal pull-up disable
1: I2C1 I/O internal pull-up enable
- I2C2HSMMASTER bit CONTROL.[CONTROL_DEVCONF1](#)[13]:
0: I2C2 I/O internal pull-up disable
1: I2C2 I/O internal pull-up enable
- I2C3HSMMASTER bit CONTROL.[CONTROL_DEVCONF1](#)[14]:
0: I2C3 I/O internal pull-up disable
1: I2C3 I/O internal pull-up enable

NOTE: This feature is used for the master component.

For more details on I²C, see [Chapter 18, I²C](#).

7.5.1.11 SDRG I/O Drive Strength Selection

- SDRG_LOWDATA bit CONTROL.[CONTROL_PROG_IO0](#)[31] selects data[15:0] DQS0, DQS1, DM0, and DM1 I/O drive strength:
0: Load range = [2 pF - 6 pF]
1: Load range = [6 pF - 12 pF]
- SDRG_HIGHDATA bit CONTROL.[CONTROL_PROG_IO0](#)[30] selects data[31:16] DQS2, DQS3, DM2, and DM3 I/O drive strength:
0: Load range = [2 pF - 6 pF]
1: Load range = [6 pF - 12 pF]
- SDRG_ADDRCTRL bit CONTROL.[CONTROL_PROG_IO0](#)[29] selects address NRAS, NCAS, NWE, NCLK, CLK, BA0, and BA1 I/O drive strength:
0: Load range = [2 pF - 6 pF]
1: Load range = [6 pF - 12 pF]
- SDRG_NCS0 bit [CONTROL_PROG_IO0](#)[28] selects NCS0 and CKE0 I/O drive strength
- SDRG_NCS1 bit [CONTROL_PROG_IO0](#)[27] selects NCS1 and CKE1 I/O drive strength

7.5.1.12 GPMC I/O Drive Strength Selection

- GPMC_A1 bit CONTROL.[CONTROL_PROG_IO0](#)[26] selects GPMC_A1 I/O drive strength.
0: Load range = [2 pF - 6 pF]
1: Load range = [6 pF - 12 pF]
- GPMC_A2 bit CONTROL.[CONTROL_PROG_IO0](#)[25] selects GPMC_A2 I/O drive strength.
0: Load range = [2 pF - 6 pF]

- 1: Load range = [6 pF - 12 pF]
- GPMC_A3 bit CONTROL.[CONTROL_PROG_IO0](#)[24] selects GPMC_A3 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_A4 bit CONTROL.[CONTROL_PROG_IO0](#)[23] selects GPMC_A4 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_A5 bit CONTROL.[CONTROL_PROG_IO0](#)[22] selects GPMC_A5 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_A6 bit CONTROL.[CONTROL_PROG_IO0](#)[21] selects GPMC_A6 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_A7 bit CONTROL.[CONTROL_PROG_IO0](#)[20] selects GPMC_A7 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_A8 bit CONTROL.[CONTROL_PROG_IO0](#)[19] selects GPMC_A8 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_A9 bit CONTROL.[CONTROL_PROG_IO0](#)[18] selects GPMC_A9 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_A10 bit CONTROL.[CONTROL_PROG_IO0](#)[17] selects GPMC_A10 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_MIN_CFG bit CONTROL.[CONTROL_PROG_IO0](#)[16] selects data[7:0] I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_D8_D15 bit CONTROL.[CONTROL_PROG_IO0](#)[15] selects data[15:8], NOE, NWE, NADV_ALE and WAIT0 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NCS0 bit CONTROL.[CONTROL_PROG_IO0](#)[14] selects GPMC_NCS0 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NCS1 bit CONTROL.[CONTROL_PROG_IO0](#)[13] selects GPMC_NCS1 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NCS2 bit CONTROL.[CONTROL_PROG_IO0](#)[12] selects GPMC_NCS2 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NCS3 bit CONTROL.[CONTROL_PROG_IO0](#)[11] selects GPMC_NCS3 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NCS4 bit CONTROL.[CONTROL_PROG_IO0](#)[10] selects GPMC_NCS4 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NCS5 bit CONTROL.[CONTROL_PROG_IO0](#)[9] selects GPMC_NCS5 I/O drive strength.

- 0: Load range = [2 pF - 6 pF]
- 1: Load range = [6 pF - 12 pF]
- GPMC_NCS6 bit CONTROL.[CONTROL_PROG_IO0](#)[8] selects GPMC_NCS6 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NCS7 bit CONTROL.[CONTROL_PROG_IO0](#)[7] selects GPMC_NCS7 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_CLK bit CONTROL.[CONTROL_PROG_IO0](#)[6] selects GPMC_CLK I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NBE0_CLE bit CONTROL.[CONTROL_PROG_IO0](#)[5] selects GPMC_NBE0_CLE I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NBE1 bit CONTROL.[CONTROL_PROG_IO0](#)[4] selects GPMC_NBE1 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_NWP bit CONTROL.[CONTROL_PROG_IO0](#)[3] selects GPMC_NWP I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_WAIT1 bit CONTROL.[CONTROL_PROG_IO0](#)[2] selects GPMC_WAIT1 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_WAIT2 bit CONTROL.[CONTROL_PROG_IO0](#)[1] selects GPMC_WAIT2 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]
- GPMC_WAIT3 bit CONTROL.[CONTROL_PROG_IO0](#)[0] selects GPMC_WAIT3 I/O drive strength.
 - 0: Load range = [2 pF - 6 pF]
 - 1: Load range = [6 pF - 12 pF]

7.5.1.13 MCBSP2 I/O Drive Strength Selection

- MCBSP2_MIN_CTL field CONTROL.[CONTROL_PROG_IO1](#)[7:6] selects FSX, CLKX, DR and DX I/O drive strength.
 - 0: 8 mA
 - 1: 4 mA
 - 2: 6 mA
 - 3: 2 mA

7.5.1.14 MCSPI1 I/O Drive Strength Selection

- MCSPI1_MIN_CTL field CONTROL.[CONTROL_PROG_IO1](#)[5:4] selects CLK, SOMI, SIMO and CS0 I/O drive strength.
 - 0: 8 mA
 - 1: 4 mA
 - 2: 6 mA
 - 3: 2 mA
- MCSPI1_CS1 field CONTROL.[CONTROL_PROG_IO1](#)[3:2] selects CS1 I/O drive strength.
 - 0: 8 mA
 - 1: 4 mA

- 2: 6 mA
- 3: 2 mA
- MCSPI1_CS2 field CONTROL.CONTROL_PROG_IO1[1:0] selects CS2 I/O drive strength.
 - 0: 8 mA
 - 1: 4 mA
 - 2: 6 mA
 - 3: 2 mA

7.5.1.15 Force MPU Writes to Be Nonposted

The MPUFORCEWRNP bit CONTROL.CONTROL_DEVCONF1[9] bit is for debugging only. When this bit is set to 1 (for debugging), all writes are forced to nonposted and the cache attributes are ignored. By default, this bit should be set to 0 (posted writes). For the best performance, keep this bit at 0.

7.5.2 Extended-Drain I/Os and PBIAS Cells Programming Guide

If the device is associated with the companion power IC, before using the MMC/SD/SDIO1 interface, the software must program the companion power IC to enable the VMMC1 or VSIM (for the MMC/SD/SDIO1 module or muxed GPIO I/Os) and the LDO and to provide a 1.8-V/3.0-V voltage. This is done by software through the I²C interface that links the device and companion power IC.

If the application does not want the selected interface running at 3.0 V, software users must then assert the VMODE signal to low for 1.8-V activity: in this case, the PBIAS is connected to ground. (See Figure 7-27.)

Table 7-59 lists the control signal with the corresponding control bits from the CONTROL.CONTROL_PBIAS_LITE register to configure the PBIAS and the extended-drain I/O cells. These signals can be software-controlled.

Table 7-59. Control Signals

Control Signal	Bit for MMC/SD/SDIO1 Module Using PBIAS0 Cell	Bit for MMC/SD/SDIO1 Module Using PBIAS1 Cell	Reset Value
PWRDNZ	CONTROL.CONTROL_PBIAS_LITE[1] PBIASLITEPWRDNZ0	CONTROL.CONTROL_PBIAS_LITE[9] PBIASLITEPWRDNZ1	0
VMODE	CONTROL.CONTROL_PBIAS_LITE[0] PBIASLITEVMODE0	CONTROL.CONTROL_PBIAS_LITE[8] PBIASLITEVMODE1	1
SUPPLY_HIGH	CONTROL.CONTROL_PBIAS_LITE[7] PBIASLITESUPPLYHIGH0	CONTROL.CONTROL_PBIAS_LITE[15] PBIASLITESUPPLYHIGH1	0
SPEEDCTRL	CONTROL.CONTROL_PBIAS_LITE[2] PBIASSPEEDCTRL0	CONTROL.CONTROL_PBIAS_LITE[10] PBIASSPEEDCTRL1	0
VMODEERROR	CONTROL.CONTROL_PBIAS_LITE[3] PBIASLITEVMODEERROR0	CONTROL.CONTROL_PBIAS_LITE[11] PBIASLITEVMODEERROR1	0

Each PBIAS cell supports two ranges of I/O power supply: 1.8 V, typical for low-voltage applications, and 3.0 V, typical for high-voltage applications. For each supply voltage range, the cell generates suitable bias voltage (PBIAS) for extended-drain PMOS devices.

NOTE: If MMC1_VDDS (or SIM_VDDS) is supplied before the device reset is released, the voltage must be 3 V. It is not recommended to supply the vdds_mmc1 (or vdds_sim) pad with 1.8 V unless software has configured the PBIAS cells accordingly.

CAUTION

A PBIAS cell must be programmed according to peripheral power supply voltage. See Table 7-60.

Table 7-60. Voltage Configuration⁽¹⁾

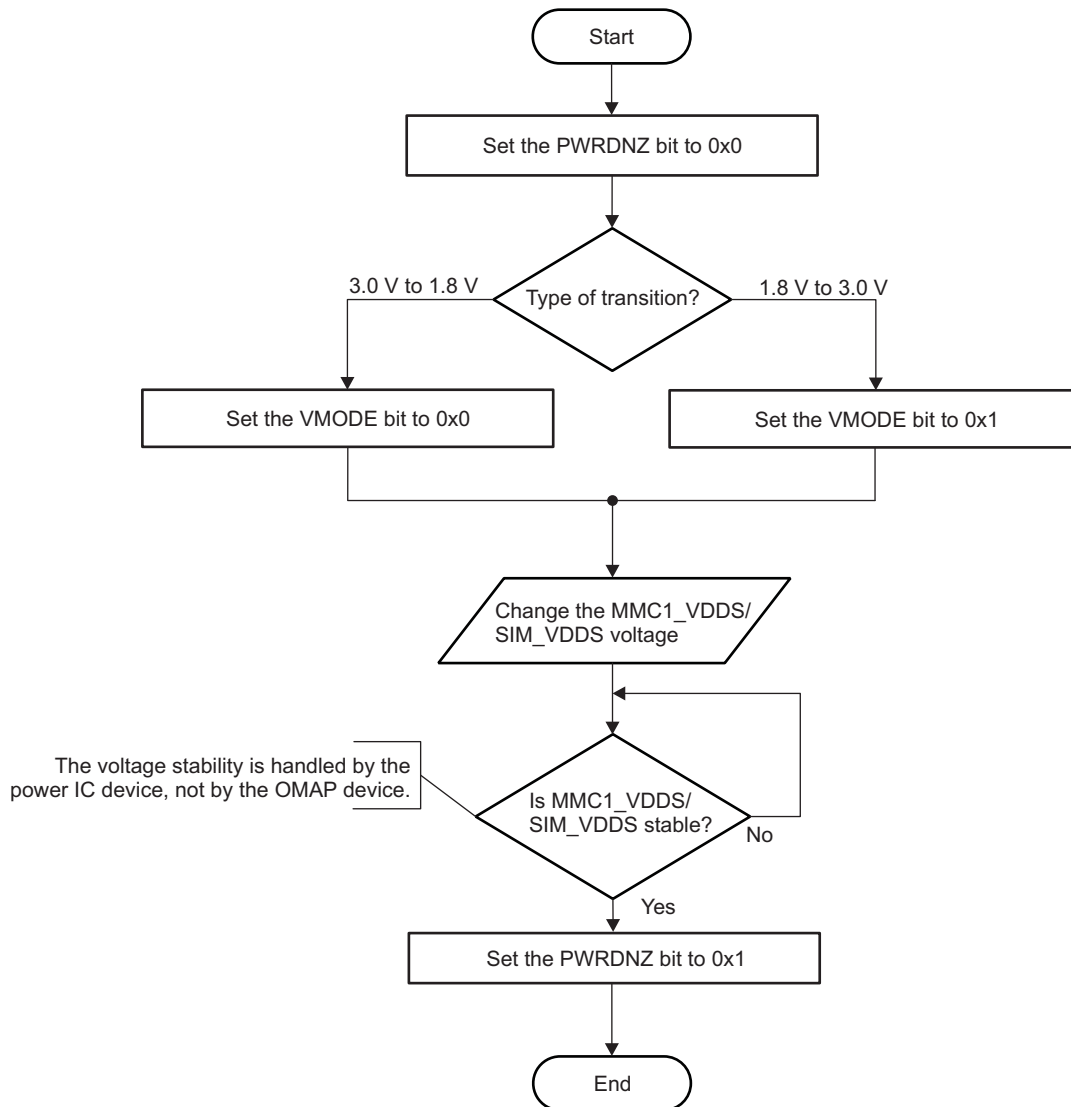

PBIASLITEVMODE Configuration	MMC1_VDDS/SIM_VDDS Voltage	Reset Value
1.8 V	1.8 V	Normal 1.8-V operation
1.8 V	3.0 V	Damaging configuration ⁽²⁾
3.0 V	1.8 V	Degraded functionality ⁽²⁾
3.0 V	3.0 V	Normal 3.0-V operation

⁽¹⁾ For damaging configuration, hardware system protection is provided to prevent deterioration of the associated extended-drain I/Os.

⁽²⁾ It is forbidden to use these modes.

Figure 7-27 describes the programming flow to go from 3.0 V to 1.8 V, and vice versa.

Figure 7-27. Flow Chart

scm-019

The PBIAS output is the same as MMC1_VDDS/SIM_VDDS when the corresponding PBIAS cell PWRDNZ bit is LOW. Once the MMC1_VDDS/SIM_VDDS supply settles, the software releases the PWRNDZ (pulls it HIGH). This then starts up the PBIAS cell work to generate the PBIAS voltage. During the complete process the MMC/SD/SDIO1 I/Os cannot be used for transmitting data.

NOTE: In the case of a damaging configuration, hardware system protection prevents deterioration of the associated extended-drain I/Os.

CAUTION

The following are critical requirements for the cell:

- The VMODE bit must be defined before the PWRNDZ bit is made HIGH (cell is brought out of PWRNDZ).
- The default state of VMODE bit must be HIGH (to indicate 3.0-V operation).
- PWRNDZ bit must be kept LOW when the MMC1_VDDS/SIM_VDDS supply is ramping up (PWRNDZ bit is not required to be kept LOW during ramp down of the supply). This could be damaging.

The following power-saving recommendations apply to the power-down mode control PWRNDZx (PBIASLITEPWRNDZ0 and PBIASLITEPWRNDZ1 bits) and the pad configuration settings for different MMC1/GPIO pad setups:

- When MMC1 (or GPIO) I/Os are used with MMC1 (or GPIO) functionality and vdds_mmc1 (or vdds_sim) = vdds = 1.8 V, the corresponding PWRNDZx bit(s) must be set to 1 when the vdds_mmc1 (or vdds_sim) power supply voltage is stabilized.
- When MMC1 (or GPIO) I/Os are not connected and vdds_mmc1 (or vdds_sim) = 0 V, the corresponding PWRNDZx bit(s) must be set to 0.
- When MMC1 (or GPIO) I/Os are not connected and vdds_mmc1 (or vdds_sim) = 1.8 V, one of the following settings can be done to reduce leakage:
 - The corresponding PWRNDZx bit(s) is kept at 0.
 - If the corresponding PWRNDZx bit(s) is 1, the INPUTENABLE bit must be maintained at 0 in the corresponding CONTROL_PADCONF_x register. In this case, the receiver buffer does not cause static current, even if the pad is left floating. Weak pullup/pulldown resistors can be used to define the pad state, if needed. The setting of a weak pull resistor does not affect the I/O leakage in this case.
 - If the corresponding PWRNDZx bit(s) must be kept at 1 and INPUTENABLE = 1, the level of the pad signal must be defined using weak pullup/pulldown resistors at the pad, in the event of a floating pad. If weak pull resistors are not defined and the pad is floating, the current, drawn from VDDS, can be high because of the static current in the receiver.

For more information about power-saving strategies related to pad configuration, see [Section 7.5.4, Pad Configuration Programming Points](#).

7.5.2.1 PBIAS Error Generation

[Table 7-61](#) summarizes the generation of the PBIAS error interrupt (PBIAS0_ERROR and PBIAS1_ERROR) depending on the various CONTROL.PBIAS_LITE bits control. The shaded row is a potential condition that could cause a reliability issue if not detected. To prevent this reliability issue, the PBIAS voltage is kept at MMC1_VDDS/SIM_VDDS level when the PBIAS error signal is HIGH.

Table 7-61. PBIAS Error Signal Truth Table

VMODE	PWRNDZ	SUPPLY_HIGH	PBIAS ERROR
X	X	X	0
0	0	X	0
0	1	0	0
0	1	1	1
X	1	X	1
1	0	X	0
1	1	0	1
1	1	1	0

NOTE: PBIAS ERROR = 1: VMODE level not same as SUPPLY_HIGH
PBIAS ERROR = 0: VMODE level same or VMODE not considered

The PBIAS errors are merged and connected to the MPU subsystem interrupt controller.

The CONTROL.[CONTROL_PBIAS_LITE](#)[i] VMODEERROR bits (with i = 3 or 11) also indicates if this kind of error occurs.

7.5.2.2 Critical Timing Requirements

It is crucial that the PBIAS and I/O cell-related PWRDNZ bits are deasserted (made 1 from 0) only after MMC1_VDDS/SIM_VDDS is stable. The device supports only the power-up sequence in which VDDS ramps up before VDD2. However, MMC1_VDDS/SIM_VDDS must come up after both VDD2 and VDDS.

[Figure 7-28](#) shows the expected behavior of PWRNDZ bit with regard to supply ramp up. It also shows the case when VDDS ramps up before VDD2.

Figure 7-28. VDDS Ramps Up Before VDD2

NOTE: These timing requirements apply only when MMC1_VDDS/SIM_VDDS is 3.0 V. If MMC1_VDDS/SIM_VDDS is 1.8 V, VDDS and MMC1_VDDS/SIM_VDDS can be ramped up simultaneously.

7.5.2.3 Speed Control and Voltage Supply State

There are two other control bits in the CONTROL.[CONTROL_PBIAS_LITE](#) register:

- SPEEDCTRL bit can be used to reduce dynamic current if fast rise/fall times are not needed.
- SUPPLYHIGH bit signal is used to inform the cell on the value of MMC1_VDDS/SIM_VDDS signal (0b0 = 1.8 V and 0b1 = 3.0 V).

7.5.3 Off Mode Preliminary Settings

The following actions must be performed once, and remain valid for all device OFF <-> ON transitions:

- Program a valid device OFF pads configuration, by setting in each CONTROL.[CONTROL_PADCONF_X](#) registers all off mode values bits: OFFPULLTYPESELECT (OFF mode pull type), OFFPULLUDENABLE (OFF mode pull enabling), OFFOUTVALUE (OFF mode output value), OFFOUTENABLE (OFF mode output enabling), OFFENABLE (OFF mode pad state override control).
- Program a valid device ACTIVE pads configuration by setting pertinent bits in each CONTROL.[CONTROL_PADCONF_X](#) register (see [Section 7.5.4, Pad Configuration Programming Points](#)).
- Perform a device ACTIVE pads configuration saving in the save and restore memory from Wake-up Control Module by asserting the STARTSAVE bit CONTROL.[CONTROL_PADCONF_OFF](#)[1].
- Set the SCM in smart idle mode by setting the IDLEMODE field CONTROL.[CONTROL_SYSCONFIG](#)[4:3] (this will ensure that its clocks can not be cut until the save procedure has completed).
- Enable/disable the wakeup-up event detection capability of the pads by setting the WAKEUPENABLE bit CONTROL.[CONTROL_PADCONF_X](#).

NOTE: When the wake-up detection is enabled for a pad, this pad is configured as input. Therefore, do not forget to write 0b1 in the OFFOUTENABLE bit CONTROL. [CONTROL_PADCONF_X](#) to disable the output capability.

For further information, see [Chapter 4, Power, Reset, and Clock Management](#).

7.5.4 Pad Configuration Programming Points

To configure the pad, ensure that the following are done:

- Identify signals required on the interface based on the target application.
Example: To configure the UART1 interface on balls, the required signals are `uart1_tx`, `uart1_rts`, `uart1_cts`, and `uart1_rx`.
- Choose the pads used for those signals. Some signals could be available on several pads and/or may be multiplexed with other signals needed for another application. See [Section 7.4.4.3, Pad Multiplexing Register Fields](#).

Example: Each UART1 interface signal is available on two pads. These signals are also multiplexed with a McBSP signal.

Assume that the McBSP interface is required in the system. Therefore, for the UART1 interface signals, pads must be used where those signals are not multiplexed with the McBSP signal.

- Identify the pad configuration registers associated with the pads to be used in the application. See [Section 7.4.4.3, Pad Multiplexing Register Fields](#).

Example: Under the previous hypothesis, the pad configuration registers to program are:

- `uart1_cts`: CONTROL.CONTROL_PADCONF_DSS_DATA0[15:0]
- `uart1_rts`: CONTROL.CONTROL_PADCONF_DSS_DATA0[31:16]
- `uart1_tx`: CONTROL.CONTROL_PADCONF_DSS_DATA6[15:0]
- `uart1_rx`: CONTROL.CONTROL_PADCONF_DSS_DATA6[31:16]

NOTE: In this configuration, `dss_data[n]` (where `n = 0`) signals are not available on these balls.

- Configure the MUXMODE field of each pad configuration register (CONTROL. [CONTROL_PADCONF_X](#)) associated with the pads used. [Section 7.4.4.3, Pad Multiplexing Register Fields](#), lists the entire mode available for each pin. Write the binary value of the mode used in the MUXMODE field of the pad configuration registers.

Example: UART1 signals are available in mode 2. Therefore, write 0b010 in the corresponding MUXMODE field of the pad configurations registers to be programmed.

- Configure the pull of the pad when used as input. When the pad is used as output, the pull is automatically disabled. [Section 7.4.4.3, Pad Multiplexing Register Fields](#), lists the pull available on each pad and its reset value. Set the appropriate value for the PULLTYPESELECT bit of the pad configuration register to set the pull value (0b0 = Pull Down selected, 0b1 = Pull Up selected) and set the PULLUDENABLE bit of the pad configuration register to enable the pull on the pad (0b0 = pull disabled, 0b1 = pull enabled)

Example: `uart1_rts` and `uart1_tx` are output signals; therefore, the pull is automatically disabled on the pad. Because `uart1_cts` and `uart1_rx` are input signals, configure the pull for these pads:

- `uart1_cts`: Enable pullup (write 0b1 in the PULLTYPESELECT bit and 0b1 in the PULLUDENABLE bit of the corresponding pad configuration register)
- `uart1_rx`: Enable pullup (write 0b1 in the PULLTYPESELECT bit and 0b1 in the PULLUDENABLE bit of the corresponding pad configuration register)

- Set the INPUTENABLE bit of the pad configuration register if the pin is used as input.

Example: `uart1_rts` and `uart1_tx` are output signals; therefore, clear the INPUTENABLE bit of the corresponding pad configuration register. Because `uart1_cts` and `uart1_rx` are input signals, set the INPUTENABLE bit of the corresponding pad configuration register.

NOTE: The order for setting the previous pad configuration bits is not important.

7.5.5 I/O Power Optimization Guidelines

To optimize I/O power, it is important to avoid unconnected or incorrectly pulled pins. According to the type of pins, the way to reduce power consumption can differ. Table 7-62 shows the three available pin (or ball) types.

Table 7-62. Pin Types

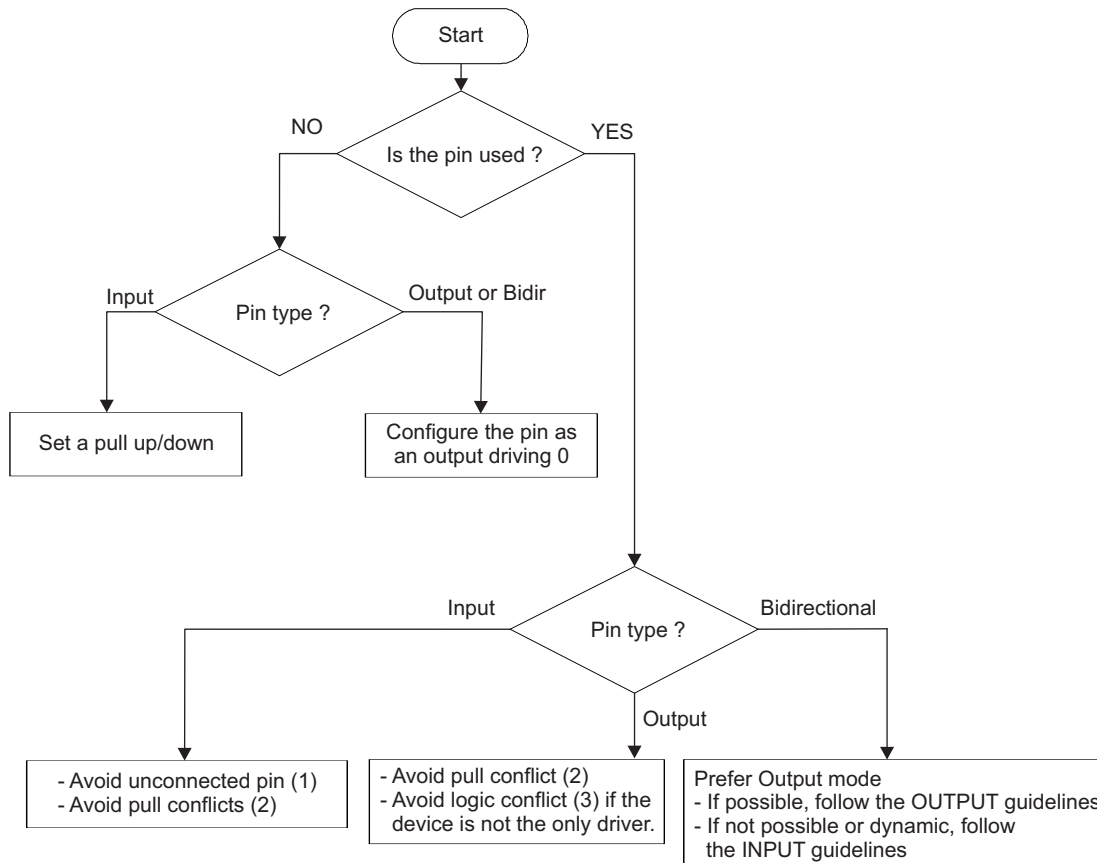

Input	Output	Bidirectional

The configuration differs according to the I/O cell types. The following describes some pieces of advice which can be useful to avoid extra current leakage:

- For input pins, use a pull up/down when possible.
 - For output pins, check existing pulls to avoid conflicts.
 - For bidirectional pins, reconfigure the pin as an output driving 0 when possible.
- Some I/O configurations involve modifications during the software setup of I/Os and sometimes require several hardware updates.

Figure 7-29 shows how to optimize the power consumption of pads.

Figure 7-29. I/O Power Optimization Flow Chart

The following notes give additional explanation about the pin configuration.

1. To avoid unconnected pins, the configuration depends on its use:
 - If the pin is not driven externally, a pull up/down is required.
 - Otherwise, a pull up/down is not necessary.
2. Pull conflicts occur when there are different pulls on the same line. In order to correctly configure the pin, avoid external and internal pull together.
3. Logic conflicts consist in different electrical levels at the same time on one line. This can occur when several devices are connected to the same line. The two possible cases are:
 - If no external device drives the line, configure the pin to drive a '0'.
 - If another device drives the line, either the same value has to be driven or the pin has to be disconnected (HZ).

NOTE: It is advised to use high impedance logical state either on the device or the external component when the line is driven by both components.

The I/O pads are software-controlled by:

- Writing to the CONTROL.CONTROL_PADCONF_X registers in the Control Module for input/output and pull up/down configuration.
 - Writing to the GPIOi.GPIO_OE registers in the GPIO module for input/output configuration.
- For more information about how to configure the I/O pads, see [Chapter 7](#), *SCM*.

For more information about the GPIO module, see [Chapter 24](#), *General-Purpose Interface*.

NOTE: For a correct configuration of each pin direction (input, output, bidirectional), the CONTROL.CONTROL_PADCONF_X and the GPIOi.GPIO_OE registers must be written.

7.6 SCM Register Manual

This section gives information about all modules and features in the high-tier device.

7.6.1 SCM Instance Summary

[Table 7-63](#) lists the base address and address space for the SCM instances.

Table 7-63. SCM Instance Summary

Module Name	Base Address	Size
INTERFACE	0x4800 2000	36 bytes
GENERAL	0x4800 2270	767 bytes
GENERAL_WKUP	0x4800 2A5C	31 bytes

A MEM_WKUP (1KB) instance exists; it based at 0x4800 2600. This instance is used in a save-and-restore context. See [Table 7-67](#) for more details.

To configure pads, two instances exist:

- PADCONF (564 bytes) instance based at 0x4800 2030. See [Table 7-65](#) for more details.
- PADCONF_FS_WKUP (80 bytes) instance based at 0x4800 2A00. See [Table 7-68](#).

7.6.2 SCM Register Summary

NOTE: All module registers are 8-, 16-, or 32-bit accessible through the L4 interconnect (little endian encoding).

[Table 7-64](#) lists the INTERFACE registers.

Table 7-64. INTERFACE Register Summary

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address
CONTROL_REVISION	R	32	0x0000 0000	0x4800 2000
CONTROL_SYSCONFIG	RW	32	0x0000 0010	0x4800 2010

[Table 7-65](#) lists the PADCONFS registers.

Table 7-65. PADCONFS Register Summary

RESERVED																IDLEMODE	ENAWAKEUP	SOFTRESET	AUTOIDLE												

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Read returns reset value.	R	0x0000000
4:3	IDLEMODE	Power Management, req/ack control 0x0: Force-idle. An idle request is acknowledged unconditionally 0x1: Reserved 0x2: Smart-idle. Acknowledgement to an idle request is given based on the internal activity of the module 0x3: Reserved	R/W	0x0
2	ENAWAKEUP	Wake-up enable. Not used in the module	R	0x0
1	SOFTRESET	Software reset. Not used in the module	R	0x0
0	AUTOIDLE	Internal interface clock gating strategy 0x0: Interface clock is free-running 0x1: Automatic interface clock gating strategy is applied, based on the interconnect interface activity	R/W	0x0

7.6.3.2 PADCONFS Register Description

Each 32-bit PADCONF register gathers the configuration of two pads. For example, CONTROL.CONTROL_PADCONF_GPMC_7 is used to configure gpmc_7 pad (bits [15:0]) and gpmc_8 pad (bits [31:16]). See [Figure 7-8](#) for more information about PADCONF registers.

According to the pad type, some features are configurable or not. [Table 7-74](#) gives the description of a fully configurable pad.

Table 7-74. CONTROL_PADCONF_X

Address Offset	0x0000 0000 - 0x0000 05C8

Bits	Field Name	Description	Type	Reset
31	WAKEUPEVENT1 See NOTE following this table.	Pad_x wake-up event status latched in the I/O: 0: No wake-up event occurred 1: A wake-up event occurred	R	0
30	WAKEUPENABLE1	Input pad wake-up enable (and OFF mode input enable value) for pad_x: 0: Wake-up detection on is disabled. 1: Wake-up detection on is enabled.	R/W	0
29	OFFPULLTYPESELECT1	Off mode Pull-Up/Down selection for pad_x: 0: Pull-Down selected 1: Pull-Up selected	R/W	0
28	OFFPULLUDENABLE1	Off mode Pull-Up/Down enable for pad_x: 0: Pull-Up/Down disabled 1: Pull-Up/Down enabled	R/W	0
27	OFFOUTVALUE1	Off mode pad_x output value	R/W	0
26	OFFOUTENABLE1	Off mode pad_x output enable value: (Warning:This is an active low signal.) 0: Output enabled 1: Output disabled	R/W	0
25	OFFENABLE1	Off mode pad_x state override control: 0: Off mode disabled 1: Off mode enabled	R/W	0
24	INPUTENABLE1	Input enable value for pad_x	R/W	1
23:21	RESERVED	Reserved	R	0
20	PULLTYPESELECT1	Pull-Up/Down selection for pad_x: 0: Pull-Down selected 1: Pull-Up selected	R/W	Pad dependent
19	PULLUDENABLE1	Pull-Up/Down enable for pad_x: 0: Pull-Up/Down disabled 1: Pull-Up/Down enabled	R/W	Pad dependent
18:16	MUXMODE1	Functional multiplexing selection for pad_x	R/W	Pad dependent
15	WAKEUPEVENT0 See NOTE following this table.	Pad_y wake-up event status latched in the I/O: 0: No wake-up event occurred 1: A wake-up event occurred	R	Pad dependent
14	WAKEUPENABLE0	Input pad wake-up enable (and OFF mode input enable value) for pad_y: 0: Wake-up detection on is disabled. 1: Wake-up detection on is enabled.	R/W	0
13	OFFPULLTYPESELECT0	Off mode Pull-Up/Down selection for pad_y: 0: Pull-Down selected 1: Pull-Up selected	R/W	0
12	OFFPULLUDENABLE0	Off mode Pull-Up/Down enable for pad_y: 0: Pull-Up/Down disabled 1: Pull-Up/Down enabled	R/W	0
11	OFFOUTVALUE0	Off mode pad_y output value	R/W	0
10	OFFOUTENABLE0	Off mode pad_y output enable value: (Warning:This is an active low signal.) 0: Off mode enabled. 1: Off mode disabled	R/W	0
9	OFFENABLE0	Off mode pad_y state override control: 0: Off mode disabled. 1: Off mode enabled	R/W	0
8	INPUTENABLE0	Input enable value for pad_y	R/W	1
7:5	RESERVED	Reserved	R	0
4	PULLTYPESELECT0	Pull-Up/Down selection for pad_y: 0: Pull-Down selected 1: Pull-Up selected	R/W	Pad dependent
3	PULLUDENABLE0	Pull-Up/Down enable for pad_y: 0: Pull-Up/Down disabled 1: Pull-Up/Down enabled	R/W	Pad dependent
2:0	MUXMODE0	Functional multiplexing selection for pad_y	R/W	Pad dependent

Table 7-75. Register Call Summary for Register CONTROL_PADCONF_X

SCM Programming Model

- [I/O Power Optimization Guidelines: \[0\] \[1\]](#)

NOTE: The WAKEUPEVENT1 of the CAM_D0 register is swapped with the WAKEUPEVENT0 of CAM_D1.

CAUTION

The OFFOUTENABLE and OFFOUTVALUE bits are functional only if the pad configuration supports output mode on at least one MUXMODE. For a pad that supports only the input feature, the OFFOUTENABLE and OFFOUTVALUE bits cannot be configured (they are don't care and read always returns 0).

NOTE: The Bits field gives the field number for the pairs of pads gathered in each register.

[Table 7-76](#) describes the reset values, the capabilities, and the corresponding register for each pad.

NOTE:

- All '-' assume that the corresponding bit is not available. These bits are considered as Reserved.
- The reset value for Reserved bits is 0.
- In the Mux Reset States and PU/PD Reset States columns of [Table 7-76](#), a dash (-) indicates that the field is hardwired to logic 0. No corresponding control block ports are implemented for these bits.

7.6.3.3 GENERAL Register Description

Table 7-77 through Table 7-237 describe the GENERAL registers bits.

Table 7-77. CONTROL_PADCONF_OFF

Address Offset	0x0000 0000	Instance	GENERAL
Physical address	0x4800 2270		
Description	Off mode pad configuration register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												WKUPCTRLCLOCKDIV	STARTSAVE	FORCEOFFMODEEN	

Bits	Field Name	Description	Type	Reset
31:3	RESERVED	Read returns reset value.	R	0x00000000
2	WKUPCTRLCLOCKDIV	Wkup_ctrl module clock divider 0x0: Clock is divided by 4. 0x1: Clock is divided by 2.	R/W	0x0
1	STARTSAVE	Start pad configuration registers save mechanism 0x0: Save is not started. 0x1: Save is running. This bit is auto-cleared after 8 interface clock cycles.	R/W	0x0
0	FORCEOFFMODEEN	Force OFF mode active 0x0: OFF mode is not forced active. 0x1: OFF mode is forced active.	R/W	0x0

Table 7-97. CONTROL_CSIRXFE

Address Offset	0x0000 0006C	Instance	GENERAL
Physical Address	0x4800 22DC		
Description	This register makes possible to control some settings of CSIRXFE cells used in the design		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
RESERVED																CSIB_RESET		CSIB_PWRDNZ		RESERVED		CSIB_SELFORM		RESERVED		CSIB_RESEnable		CSIB_INV		RESERVED					

Bits	Field Name	Description	Type	Reset
31:14	RESERVED	Read returns reset value.	R	0x0
13	CSIB_RESET	Active Low asynchronous reset signal for CSIB_interface	R/W	0x0
12	CSIB_PWRDNZ	Power Down control for CSIB_interface 0: CSIB differential transceiver is powered down 1: CSIB differential transceiver is active	R/W	0x0
11	RESERVED	Read returns reset value.	R	0x0
10	CSIB_SELFORM	CSI receiver transmission format selection for CSIB_interface 0: Data/clock transmission format. 1: Data/Strobe transmission format	R/W	0x0
9	RESERVED	Read returns reset value.	R	0x0
8	CSIB_RESEnable	Enable resistor for CSIB_interface 0: CSIB internal resistor is disconnected (use external termination resistor) 1: CSIB internal resistor is enabled	R/W	0x0

Bits	Field Name	Description	Type	Reset
		0x0: No access error to Camera DMA protection channels 0x1: Unauthorized access to a Camera DMA protection channel		
8	SYSDMAACC ERROR	sDma Access Error	R	0x0
		0x0: No access error to sDMA protection channels 0x1: Unauthorized access to a sDMA protection channel		
7	L4COREFW ERROR	L4 Protection Firewall Error	R	0x0

Table 7-169. CONTROL_USBHOST_DPLL_SPREADING

Address Offset	0x0000 01EC	Instance	GENERAL
Physical Address	0x4800 245C		
Description	This register controls the EMI Reduction feature for USBHOST DPLL		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																USBHOST_SPREADING_ENABLE_STATUS	RESERVED		USBHOST_SPREADING_ENABLE	USBHOST_SPREADING_AMPLITUDE	USBHOST_SPREADING_RATE										

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Reads return zero	R	0x000000
7	USBHOST_SPREADING_ENABLE_STATUS	Indicates the status of the Spreading feature	R	-
6:5	RESERVED	Reads return zero	R	0x0
4	USBHOST_SPREADING_ENABLE	Enables/disables EMI Reduction feature (Spreading): 0: Modulation stops at the end of the current modulation cycle. 1: Modulation cycle is started.	RW	0x0
3:2	USBHOST_SPREADING_AMPLITUDE	Controls the modulation index. This index (K) is a ratio of Frequency spread (Δf) and spreading rate (f_m) . 00: K = 4 01: K = 6 10: K = 8 11: K = 10	RW	0x0
1:0	USBHOST_SPREADING_RATE	Controls the rate of frequency modulation: 00: 62.5 to 125 KHz 01: 125 to 250 KHz 10: 250 to 500 KHz 11: 500 to 1000 KHz	RW	0x0

7.6.3.4 MEM_WKUP Register Description

Physical addresses 0x4800 2600 to 0x4800 29FC are memories mapped for save and restore location (1KB).

- 0x4800 2600 - 0x4800 28A0: nonaccessible (pad configuration)
- 0x4800 28A4 - 0x4800 29FC: user accessible

7.6.3.5 PADCONFS_WKUP Register Description

Each 32-bit PADCONF register gathers the configuration of two pads. For example, CONTROL.CONTROL_PADCONF_GPMC_7 is used to configure gpmc_7 pad (bits [15:0]) and gpmc_8 pad (bits [32:16]). See [Figure 7-8](#) for more information about PADCONF registers.

According to the pad type, some features are configurable or not. [Table 7-74](#) gives the description of a fully configurable pad.

[Table 7-239](#) describes the reset values, the capabilities, and the corresponding register for each pad.

NOTE:

- All '-' assume that the corresponding bit is not available. These bits are considered as Reserved.
- The reset value for Reserved bits is 0.
- In the Mux Reset States and PU/PD Reset States columns of [Table 7-239](#), a dash (-) indicates that the field is hardwired to logic 0. No corresponding control block ports are implemented for these bits.

Memory Management Units

This chapter describes the memory management units (MMUs).

NOTE: Some features may not be available or supported in your particular device. For more information, see Chapter 1, the Device Family section, and your device-specific data manual.

Topic	Page
8.1 MMU Overview	934
8.2 MMU Integration	935
8.3 MMU Functional Description	938
8.4 MMU Basic Programming Model	951
8.5 MMU Register Manual	958

8.1 MMU Overview

The device contains three memory management units (MMUs):

- Microprocessor unit (MPU) MMU
- Camera MMU
- Image Video and Audio accelerator (IVA2.2) MMU

The camera MMU and IVA2.2 MMU share the same architecture and are both described in this chapter. The MPU MMU, which implements a different architecture, is covered in [Chapter 3, MPU Subsystem](#).

NOTE: The MMUn prefix provides information about the register instantiation, where n = 1 for the camera MMU, and n = 2 for the IVA2.2 MMU.

The MMU instances include the following main features:

- N entries fully associative translation look-aside buffer (TLB) with N = 8 for the camera MMU and N = 32 for the IVA2.2 MMU
- 1 interrupt line out to the MPU subsystem
- 32-bit virtual addresses, 32-bit physical address
- Mapping size: 4KB and 64KB pages, 1MB section, and 16MB supersection
- Predefined (static) or table-driven (hardware table walker) software translation strategies

[Figure 8-1](#) shows the MMU instances.

Figure 8-1. Device MMU Instances

8.2 MMU Integration

The MMU communicates accesses from the requestor (either the camera subsystem or the IVA2.2) to the L3 main interconnect, performing virtual to physical address translation. The camera MMU is programmed through the L4-core interconnect. The IVA2.2 MMU is programmed through the L3 interconnect. Both MMU error conditions are signaled as interrupts to the system master processor (that is, the MPU).

Figure 8-2 and Figure 8-3 show the system integration of the camera MMU instance and the IVA2.2 MMU instance.

Figure 8-2. Camera MMU System Integration

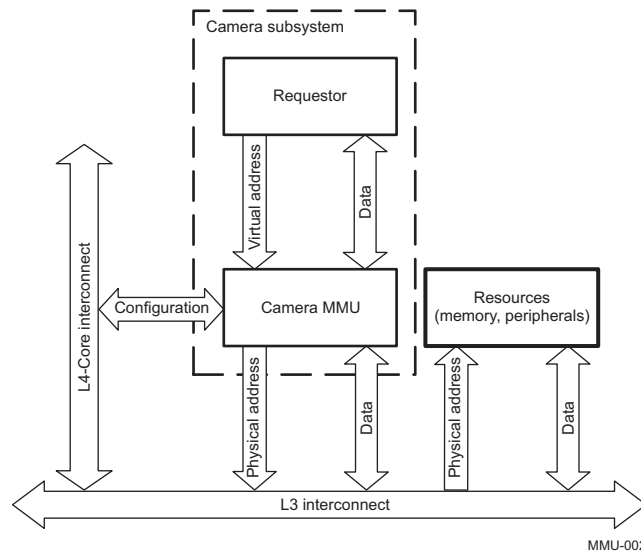

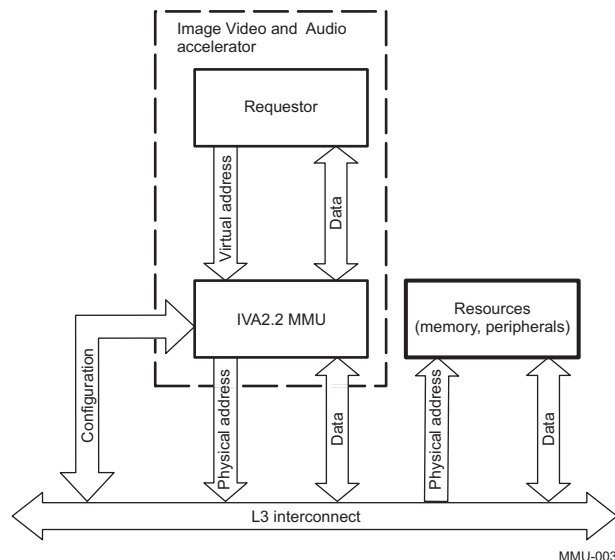

Figure 8-3. IVA2.2 MMU System Integration

8.2.1 Clock Domains

The camera MMU instance has two clock domains: the functional clock domain for the MMU, which is synchronous to the L3 interconnect clock, and the L4 interconnect clock, which is used to configure the MMU instance. Both camera MMU clocks are derived from a common reference clock generated by the power reset and clock management (PRCM) module.

The IVA2.2 MMU instance has only one clock domain: the functional clock domain for the MMU. The IVA MMU clock is generated by the DPLL2 embedded in IVA2.2, but controlled by PRCM registers.

8.2.2 Power Management

The functional units are grouped into power domains. Each power domain is a section of the device with independent and dedicated power rails. Fifteen different power domains exist. For information about power management, see [Chapter 4, Power, Reset, and Clock Management](#).

The MMU instances belong to different power domains. [Table 8-1](#) shows the correspondence between the MMU instance and power domains.

Table 8-1. Power Domains of the MMU Instances

MMU Instance	Power Domain
MMU1 (camera MMU)	CAM
MMU2 (IVA2.2 MMU)	IVA2

8.2.2.1 System Power Management

As part of the system-wide power management scheme, each MMU instance supports a communication protocol with the PRCM module that allows the PRCM module to request an MMU instance to enter a low-power state. When the MMU instance acknowledges a low-power mode request from the PRCM module, the clock to the instance is gated off at the PRCM clock generator. Because the clock is disabled at the source, the low-power mode offers lower power consumption than the internal clock gating method in the local power management.

The MMU instance can be configured through the MMUn.MMU_SYSCONFIG[4:3] IDLEMODE field as one of the following acknowledgement modes:

- No-idle mode: The MMU instance never enters the idle state.
- Force-idle mode: The MMU instance immediately enters the idle state after receiving a low-power mode request from the PRCM module. In this mode, the software must ensure that there are no pending interrupts before requesting this mode to go into the idle state; otherwise, an error can occur.
- Smart-idle mode: After receiving a low-power mode request from the PRCM module, the MMU instance enters the idle state only after all interrupts are acknowledged.

[Table 8-2](#) describes the MMU power management modes. For details, see the [MMU_SYSCONFIG](#) register.

Table 8-2. Power Domains of the MMU Instances

Power Management Mode Requested by the PRCM	MMUn.MMU_SYSCONFIG[4:3] IDLEMODE field
Force-idle	00
No-idle	01
Smart-idle	10
Reserved	11

8.2.2.2 Module Power Saving

To conserve power, the MMU instance supports an automatic idle mode whenever activity is not detected on the configuration register port of the MMU instance. The automatic idle mode is enabled or disabled through the MMUn.MMU_SYSCONFIG[0] AUTOIDLE bit.

If the MMUn.MMU_SYSCONFIG[0] AUTOIDLE bit is asserted, the automatic idle mode is enabled when activity is not detected on the configuration register port, and the MMU instance clock is disabled internally to the module, thereby reducing power consumption.

When new activity is detected on the configuration register port, the clock is restarted with no latency penalty. After reset, the automatic idle mode is disabled; therefore, it is recommended to enable the automatic idle mode to reduce power consumption.

8.2.3 Reset

The MMU instances are reset together with their respective reset domains. [Table 8-3](#) shows the correspondence between the MMU instances and the reset domains.

Table 8-3. Reset Domains of the MMU Instances

MMU Instance	Reset Domain
MMU1 (camera MMU)	CAM_RST
MMU2 (IVA2.2 MMU)	IVA_RST2

Software reset is applied when the MMUn.MMU_SYSCONFIG[1] SOFTRESET is set to 1. The MMUn.MMU_SYSSTATUS[0] RESETDONE bit can be polled to know the reset status.

When an MMU instance is released from reset, its TLB is empty and the MMU is disabled.

NOTE: IVA2.2 MMU can be accessed from the L3 interconnect (configuration registers) even if the DSP is still under reset (IVA_RST1 active).

8.2.4 Interrupts

Each MMU instance can generate an interrupt to the MPU on the occurrence of the following predefined set of events:

- Multi-hit fault
There is more than one TLB entry for the given virtual address.
- Table walk fault
A table walk data read generated an error.
- Emulation miss
A TLB miss was caused by an emulation access.
- Translation fault
No translation is found for the given virtual address. The hardware table walker is enabled but no valid page table entry exists for the requested address.
- TLB miss with table walk disabled
No translation is found in the TLB for the given virtual address and the table walking logic is disabled.

Each of these events can be individually enabled and disabled using the MMUn.MMU_IRQENABLE register. If an event occurs and is enabled, an interrupt is generated to the MPU. The MPU can use the MMUn.MMU_IRQSTATUS register to find the precise cause of the interrupt.

The MMUn.MMU_FAULT_AD register holds the virtual address of the translation that causes the interrupt. The MMUn.MMU_EMU_FAULT_AD indicates the address of the last emulation event causing an MMU interrupt.

[Table 8-4](#) shows the generated interrupt versus the MMU instance.

Table 8-4. Interrupts of the MMU Instances

MMU Instance	MMU Interrupt Name	MMU Interrupt Mapping
MMU1 (camera MMU)	CAM_IRQ0	M_IRQ_24
MMU2 (IVA2.2 MMU)	IVA2_MMU_IRQ	M_IRQ_28

NOTE: The IVA2_MMU_IRQ (MMU2 instance) interrupt is a dedicated interrupt to the MPU subsystem.

[Chapter 12, Camera Subsystem](#), and [Chapter 14, IVA2.2 Subsystem](#), outline details about interrupt generation in the camera and IVA2.2 subsystems. For details about the MPU interrupt scheme, see [Chapter 10, Interrupt Controller](#).

8.3 MMU Functional Description

The MMUs handle the translation from virtual into physical addresses. The requestor (either the camera subsystem or the DSP mega cell or the EDMA module for IVA2.2) issues virtual addresses to the respective MMU (MMU1 for the camera subsystem and MMU2 for the IVA2.2). The MMU translates these virtual addresses into physical addresses to access the actual resource (memory) when the MMU instance is enable. That is when MMUn.MMU_CNTL[1] MMUENABLE is set to 1.

Figure 8-4 shows the relationship between the physical address, the virtual address, and the MMU.

Figure 8-4. MMU Address Translation

8.3.1 MMU Benefits

The MMU offers two major benefits:

- Memory defragmentation: Fragmented physical memory can be translated into contiguous virtual memory without moving data.
- Memory protection: Illegal, that is, non-allowed accesses to memory locations can be detected and prevented.

Figure 8-5 shows two typical MMU use cases.

Figure 8-5. MMU Usage Examples

MMU-005

Figure 8-5 shows two benefits of using an MMU. Memory region 1 and memory region 2 are fragmented in physical memory. Using the MMU, they appear as one contiguous memory region in the virtual memory space.

On the other hand, task 1 and task 2 are located adjacent to each other in physical memory. In systems without an MMU, there is a danger that task 1 can accidentally write into the memory area allocated to task 2 and vice versa. Allocating task 1 and task 2 into two separate virtual memory regions prevents this problem, because a region of unmapped memory separates the two tasks. Any erroneous access to this region results in an error that can be detected easily.

8.3.2 MMU Architecture

The MMU translation process is based on translation entries stored in translation tables. One first-level translation table can exist with several optional second-level translation tables.

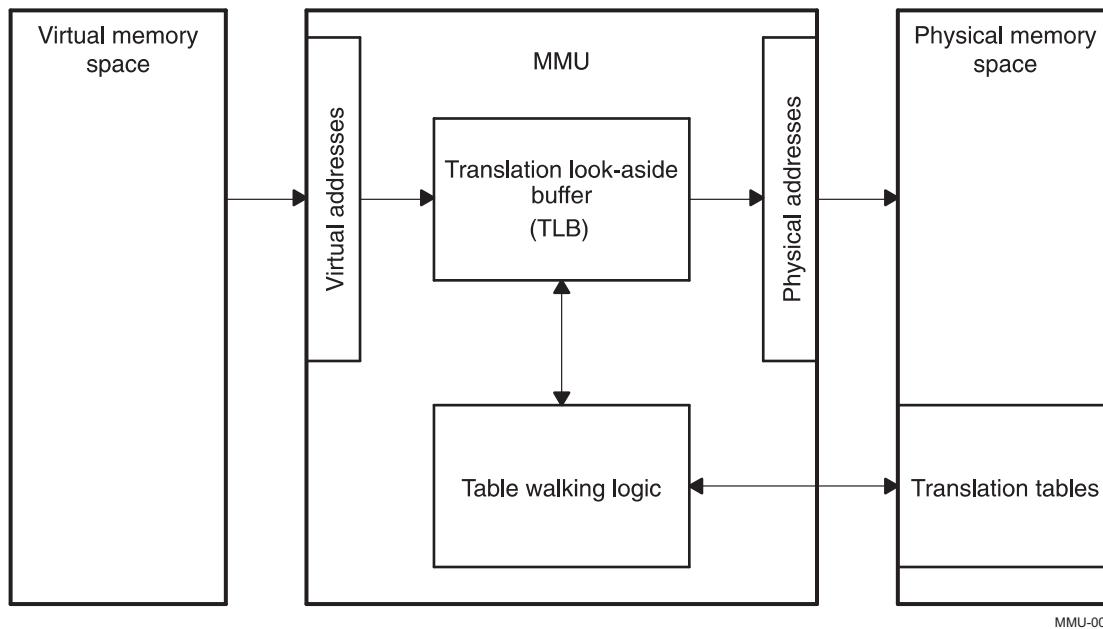

Each table entry describes the translation of one contiguous memory region. For a description of the structure of these tables, see Section 8.3.3, *Translation Tables*.

Two major functional units exist in the MMU to provide address translation automatically based on the table entries:

- The table walker automatically retrieves the correct translation table entry for a requested translation. If two-level translation is used (for the translation of small memory pages), the table walker also automatically reads the required second-level translation table entry. Two-level translation is described in [Section 8.3.3.3, Two-Level Translation](#).
- The TLB stores recently used translation entries, acting like a cache of the translation table.

This basic architecture is outlined in [Figure 8-6](#).

Figure 8-6. MMU Architecture

8.3.2.1 MMU Address Translation Process

Whenever an address translation is requested (that is, for every access with the MMU enabled), the MMU first checks whether the translation is already contained in the TLB, which acts like a cache storing recent translations. The TLB can also be programmed manually to ensure that time-critical data can be translated without delay.

If the requested translation is not in the TLB, the table-walking logic retrieves this translation from the translation table(s), and then updates the TLB. The address translation is then performed. [Figure 8-7](#) summarizes the process.

Figure 8-7. Translation Process

MMU-007

8.3.3 Translation Tables

The translation of virtual to physical addresses is based on entries in translation tables that define the following properties:

- Address translation, that is, the correspondence between virtual and physical addresses
- Size of the memory region the entry translates
- Endianness, data access size, and the mixed property of this memory region

The virtual addresses index the translation tables. Each virtual address corresponds to exactly one entry in the translation table.

8.3.3.1 Translation Table Hierarchy

When developing a table-based address translation scheme, one of the most important design parameters is the memory page size described by each translation table entry. MMU instances support 4KB and 64KB pages, a 1MB section, and a 16MB supersection. Using bigger page sizes means a smaller translation table.

Using a smaller page size greatly increases the efficiency of dynamic memory allocation and defragmentation. That is why many operating systems (OSs) can operate on memory blocks as small as 4KB; however, the smaller size implies a more complex table structure.

A quick calculation shows that using 4KB memory pages with one translation table would require one million entries to span the entire 4GB address range. The table itself would be 32MB, a size that is not feasible.

However, using bigger pages greatly reduces the functionality of the OS memory management. Implementing a two-level hierarchy reconciles these two requirements. Within this hierarchy, one first-level translation table describes the translation properties based on 1MB memory regions.

Each of the entries in this first-level translation table can specify the following:

- The translation properties for a big memory section. This memory section can be either 1MB (section) or 16MB (supersection). In this case, all translation parameters are specified in the first-level translation table entry.

- A pointer to a second-level translation table that specifies individual translation properties based on smaller pages within the 1MB page of memory. These pages can be either 64KB (large page) or 4KB (small page). In this case, the actual translation parameters are specified in the second-level translation table entry. The first-level translation table entry specifies only the base address of the second-level translation table.

This hierarchical approach means that additional translation information for smaller pages must be provided only when the pages are actually used. [Figure 8-8](#) shows this hierarchy.

Figure 8-8. Translation Hierarchy

MMU-008

The structure of the first and second-level translation tables and their entries are described in more detail in [Section 8.3.3.2, First-Level Translation Table](#), and [Section 8.3.3.3, Two-Level Translation](#).

8.3.3.2 First-Level Translation Table

The first-level translation table describes the translation properties for 1MB sections. To describe a 4GB address range requires 4096 32-bit entries (so-called first-level descriptors).

The first-level translation table start address must be aligned on a multiple of the table size with a 128-byte minimum. Consequently, an alignment of at least 16K bytes is required for a complete 4096-entry table; that is, at least the last fourteen address bits must be zero.

The start address of the first-level translation table is specified by the so-called translation table base. The table is indexed by the upper 12-bits of the virtual address. This mechanism is shown in [Figure 8-9](#).

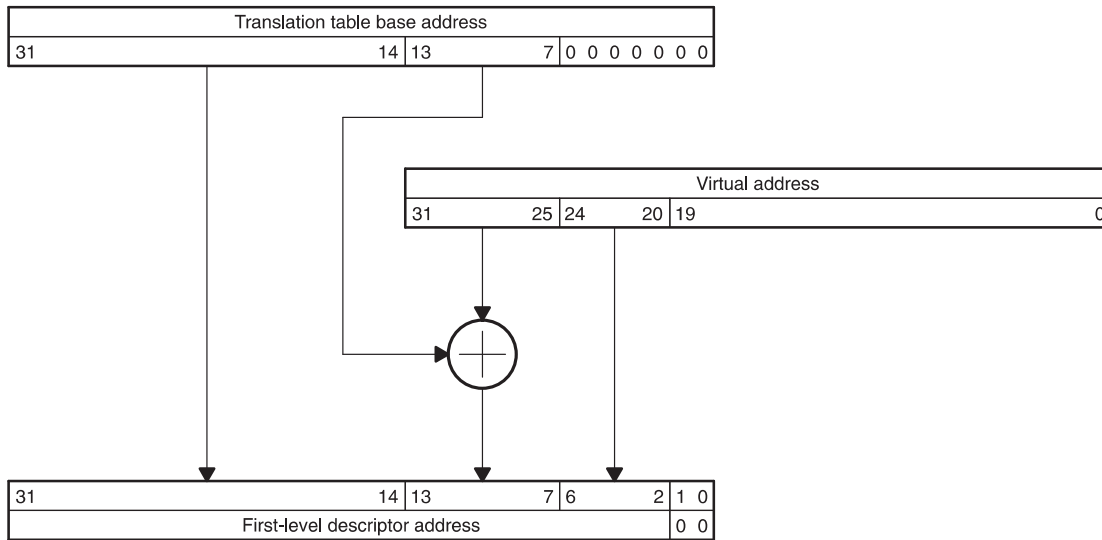

Figure 8-9. First-Level Descriptor Address Calculation

MMU-009

To summarize, the translation table base and the translation table index together define the first-level descriptor address. [Figure 8-10](#) outlines the precise mechanism used to calculate this address.

Figure 8-10. Detailed First-Level Descriptor Address Calculation

MMU-010

As an example of this mechanism, consider a translation table base address of 0x8000:0000 and a virtual address of 0x1234:5678. In this case, the first-level descriptor address is $0x8000:0000 + (0x123 \ll 2) = 0x8000:048C$.

8.3.3.2.1 First-Level Descriptor Format

Each first-level descriptor provides either the complete address translation for 1MB or 16MB sections or provides a pointer to a second-level translation table for 4KB or 64KB pages. The first-level descriptor format is shown in [Table 8-5](#).

Table 8-5. First-Level Descriptor Format

First-Level Descriptor Format													
31:24	23:20	19	18	17	16	15	14:12	11:10	9:2	1	0		
X											0	0	Fault
Second-Level Translation Table Base Address									X	0	1	Page	
Section Base Address		X	0	M	X	E ⁽¹⁾	X	ES	X	1	0	Section	
Supersection Base Address		X	1	M	X	E	X	ES	X	1	0	Supersection	
X											1	1	Fault

⁽¹⁾ See [Table 8-34](#) for endianness limitations.

M = Mixed region: 0 = Page-based endianness, 1 = Access-based endianness

E = Endianness: 0 = Little endian, 1 = Big endian (endianness is locked on little endian)

ES = Element Size: 00 = 8-bit, 01 = 16-bit, 10 = 32-bit, 11 = No endianness conversion

X = Don't care

8.3.3.2.2 First-Level Page Descriptor Format

If a translation granularity smaller than 1MB is required, a two-level translation process is used. In this case, the first-level block descriptor specifies only the start address of a second-level translation table. The second-level translation table entries specify the actual translation properties.

8.3.3.2.3 First-Level Section Descriptor Format

Each section descriptor in the first-level translation table specifies the complete translation properties for a 1MB section or a 16MB supersection.

NOTE: Supersection descriptors must be repeated 16 times, because each descriptor in the first-level translation table describes 1MB of memory. If an access points to a descriptor which is not initialized, MMU will behave in an unpredictable way.

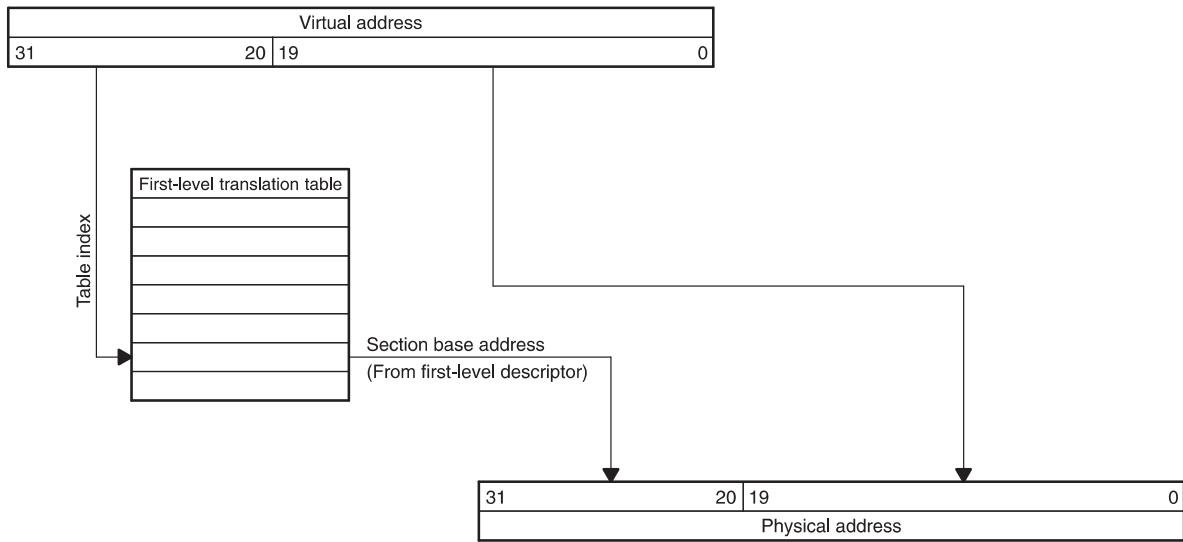

In addition to the address translation itself, three parameters are specified in the section descriptors:

- **Endianness**
The *endianness* parameter specifies whether the memory section uses a big- or little-endian data format. This parameter is locked to little endian. See [Table 8-34](#) for more information.
- **Element size**
The *element size* parameter can optionally specify the data access size (8, 16, or 32 bits) for all data items in the defined section.
- **Mixed region**
The *mixed region* parameter specifies whether the information about the data access size is detected from the access itself (access-based detection) or if the specified element size parameter is used (page-based detection). For example, the specified element size parameter can be used when several smaller sized accesses are packed into a bigger sized access, such as two 16-bit accesses packed into one 32-bit access. In this case, with no specified data access size, 32 bits would be the access size detected, leading to an incorrect result. To avoid this problem, specify the data access size for the memory section.

8.3.3.2.4 Section Translation Summary

Sections and supersections can be translated based solely on the information in the first-level translation table. [Figure 8-11](#) summarizes the address translation process for a section.

Figure 8-11. Section Translation Summary

MMU-011

8.3.3.2.5 Supersection Translation Summary

The translation of a supersection is similar to the translation of a section. The difference is that for a supersection only bits 31 to 24 index into the first-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a supersection.

[Figure 8-12](#) shows the translation mechanism for a supersection.

Figure 8-12. Supersection Translation Summary

8.3.3.3 Two-Level Translation

Two-level translation is used when fine-grain granularity is required, that is when memory sections smaller than 1MB are needed. In this case, the first-level descriptor provides a pointer to the base address of a second-level translation table. This second-level table is indexed by bits 19 to 12 of the virtual address. Figure 8-13 shows this indexing mechanism.

Figure 8-13. Two-Level Translation

Each second-level translation table describes the translation of 1MB of address space in pages of 64KB (large page) or 4KB (small page). It consists of 256 second-level descriptors describing 4KB each.

NOTE: In the case of a large page, the same descriptor must be repeated 16 times. If an access points to a descriptor which is not initialized, MMU will behave in an unpredictable way.

8.3.3.3.1 Second-Level Descriptor Format

Similar to first-level section descriptors, second-level descriptors provide all of the necessary information for the translation of a large or small page. Table 8-6 shows the format of second-level descriptors. The translation parameters (endianness, element size, and mixed region) have the same meaning as those for sections.

Table 8-6. Second-Level Descriptor Format

Second-Level Descriptor Format											
31:16	15:12	11	10	9	8:6	5:4	3:2	1	0		
X									0	0	Fault
Large Page Base Address	X	M	X	E ⁽¹⁾	X	ES	X	0	1	Large Page	
Small Page Base Address		M	X	E	X	ES	X	1	X	Small Page	

⁽¹⁾ See Table 8-34 for endianness limitations.

M = Mixed region: 0 = Page-based endianness, 1 = Access-based endianness

E = Endianness: 0 = Little-endian, 1 = Big-endian (endianness is locked on little endian)

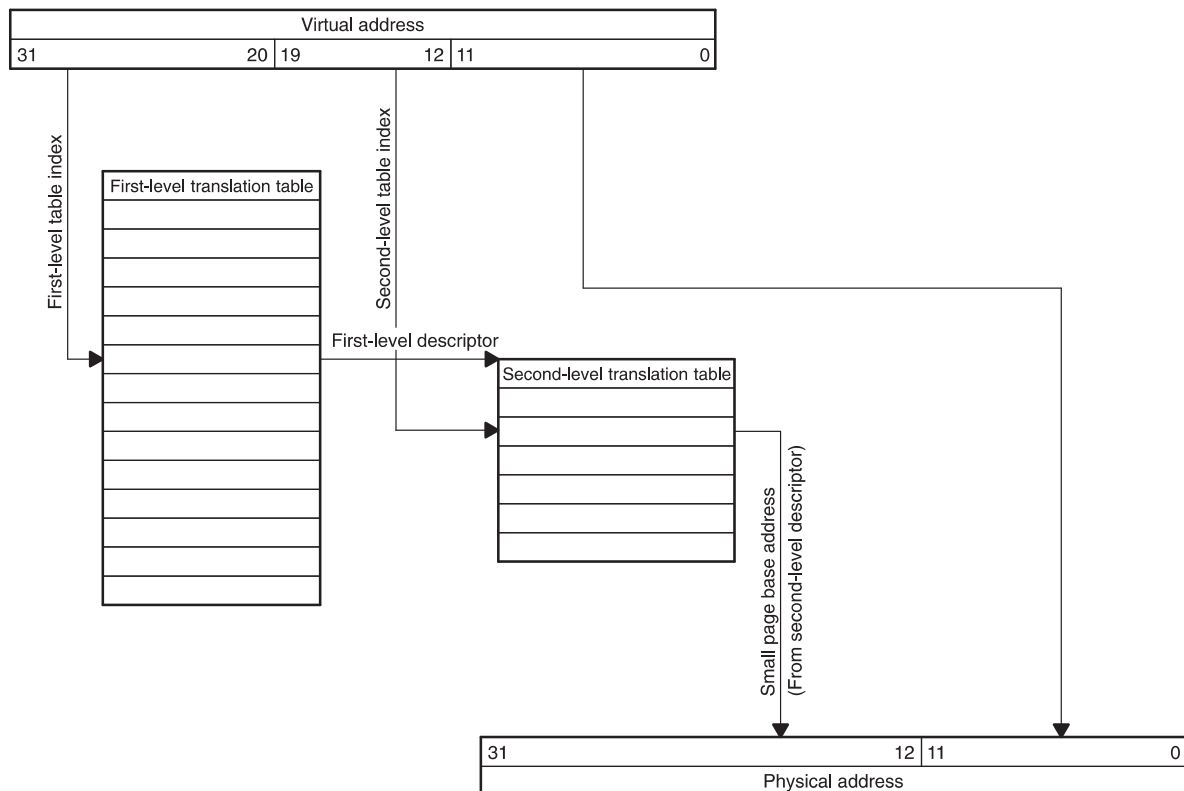

ES = Element Size: 00 = 8-bit, 01 = 16-bit, 10 = 32-bit, 11 = No endianness conversion

X = Don't care

8.3.3.3.2 Small Page Translation Summary

Figure 8-14 summarizes the translation process for small pages.

Figure 8-14. Small Page Translation Summary

MMU-014

8.3.3.3 Large Page Translation Summary

The translation of a large page is similar to the translation of a small page. The difference is that, for a large page, only bits 19 to 16 index into the second-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a large page. This is shown in Figure 8-15.

Figure 8-15. Large Page Translation Summary

MMU-015

8.3.4 Translation Lookaside Buffer

Translating virtual to physical addresses is required for each memory access in systems using an MMU. To accelerate this translation process, a cache, or TLB, holds the result of recent translations.

For every translation, the MMU internal logic first checks whether the requested translation is already cached in the TLB. If the translation is cached, this translation is used; otherwise the translation is retrieved from the translation tables and the TLB is updated. If the TLB is full, one of its entries must be replaced. This entry is selected on a random basis.

The first n TLB entries, where $n < Total\ Number\ N\ of\ TLB\ Entries$, can be protected (locked) against being overwritten by setting the TLB base pointer to n . When this mechanism is used, only unprotected entries can be overwritten. The victim pointer indicates the next TLB entry to be written. Figure 8-16 shows an example of TLB with N TLB entries (ranging from 0 to $N-1$). The base pointer contains the value "3" protecting Entry 0, Entry 1, and Entry 2 and the victim pointer points to the next TLB entry to be updated.

NOTE: The last TLB entry (Entry $N-1$, where $N = 8$ for the camera MMU and $N = 32$ for the IVA2.2 MMU) always remains unprotected.

Figure 8-16. TLB Entry Lock Mechanism

MMU-016

The table walking logic automatically writes the TLB entries. The entries can also be manually written, which is done typically to ensure that the translation of time-critical data accesses is already present in the TLB so that they execute as fast as possible. The entries must be locked to prevent them from being overwritten.

8.3.4.1 TLB Entry Format

TLB entries consist of two parts:

- The CAM part contains the virtual address tag used to determine if a virtual address translation is in the TLB. The TLB acts like a fully associative cache addressed by the virtual address tag. The CAM part also contains the section/page size, as well as the preserved and the valid parameters. See the [MMU_CAM](#) register table for more details.
- The RAM part contains the address translation that belongs to the virtual address tag as well as the endianness, element size, and mixed parameters described in [Section 8.3.3.2, First-Level Translation Table](#). See the [MMU_RAM](#) register table for more details.

The valid parameter specifies whether an entry is valid or not. The preserved parameter determines the behavior of an entry in the event of a TLB flush. If an entry is set as preserved, it is not deleted when a TLB is flushed, that is when [MMU_GFLUSH\[0\] GLOBALFLUSH](#) is set to 1. Preserved entries must be deleted manually. [Section 8.3.3.2, First-Level Translation Table](#), describes the procedure to delete TLB entries.

[Figure 8-17](#) shows the TLB entry structure.

Figure 8-17. TLB Entry Structure

MMU-017

8.3.5 MMU Error Handling

The following types of faults can occur:

- TLB miss with table walker disabled
No translation is found for the virtual address required. If the hardware table walker is disabled, a fault is generated.
- Translation fault
No translation is found for the virtual address required (TLB miss). The table walker is enabled but a page table entry does not exist for the given virtual address.
- Table walk fault
A table walk results in a memory read error.
- Multi-hit fault
More than one valid entry exists in the TLB for the given virtual address.

When a fault occurs and its corresponding interrupt is enabled, an interrupt is signaled to the MPU. The interrupt service routine (ISR) is then responsible for fault recovery. The requestor is stalled by the MMU while the fault is handled. For example, for a TLB miss, the ISR might load the missing entry into the TLB.

The ISR can determine the cause of the fault interrupt by reading the MMU's [MMU_IRQSTATUS](#) register. The virtual address that caused the fault can be determined by reading the MMU's [MMU_FAULT_AD](#) register.

In the case of a TLB miss, the MMU continues servicing the request as soon as a valid TLB entry is written. In the case of a translation fault, table walk fault, or multi-hit fault, the ISR first addresses the cause of the fault and then releases the MMU by writing to the interrupt status register. The MMU then continues servicing the request.

8.3.6 MMU Instance Design Parameters

The various MMU instances have different design parameters, most notably the size of the virtual address space and the number of TLB entries. [Table 8-7](#) shows the correspondence between the MMU instances and the design parameters.

Table 8-7. Design Parameters of the MMU Instances

MMU Instance	Virtual Address Space	TLB Entries
MMU1 (camera MMU)	4GB	8 entries
MMU2 (IVA2.2 MMU)	4GB	32 entries

8.4 MMU Basic Programming Model

MMU instances handle translation from virtual into physical addresses. Virtual addresses are issued by the Camera or the IVA2.2 subsystems to the MMU, which converts them into physical addresses. These physical addresses correspond to actual memory resource. Refer to [Chapter 2, Memory Mapping](#) for more information on the device memory mapping.

MMU instances can be used dynamically or statically, in other words, MMU can be managed by the MPU software or configured directly.

An MMU is configured dynamically when a software subroutine writes translation tables into the appropriate physical memory space. Translation tables are most likely stored in external SDRAM (see SMS, [Section 11.2.4.1, SDRAM Memory Scheduler](#), for more details). They are automatically written by the MPU OS (Symbian™, Linux®,...). Operating System may limit the memory section size to page or sections. A MPU memory management software treats all information concerning addressing. Sub-set tables can be copied into external SDRAM to automatically create a given MMU translation table. Features such as mixed region, endianness, element size are then overwritten in SDRAM to match one's need and customize Camera or IVA2.2 subsystems' need (8-bit exchange in little-endian format for example). Note that 16MB sections and 64KB page table entries must be duplicated 16 times with the same content in translation tables. This process avoids a second read operation when an access points to another element than first one in the table. If they are not copied the MMU will behave in an unpredictable way.

When an MMU is configured statically, translation tables are not used, and TLB entries are written directly by the programmer.

[Figure 8-18](#) shows the configuration strategies: static, dynamic and mixed use of MMU.

Figure 8-18. MMU Configuration Strategies

MMU-018

MMU components must be set up before the MMU can be used for address translation. The following steps are required:

- Initialize translation tables and the table walker logic if translation tables are used.
- Write TLB entries if required.
- Enable MMU.

Next paragraph explains how to configure the IVA2.2 MMU by directly writing the entries in the Translation Look-aside Buffer (TLB). The focus of this example is to explain the required configuration steps rather than to provide the most efficient implementation.

8.4.1 Writing TLB Entries Statically

This example deals with predefined translation strategy, that is, entries are “statically” written in the TLB.

This method avoids the need to write Translation tables in memory and is commonly used for relatively small address spaces. It ensures that the translation of time-critical data accesses execute as fast as possible with entries already present in the TLB. These entries must be locked to prevent them from being overwritten. To setup the MMU follow those steps:

1. Reset MMU: write `MMU_SYSCONFIG[1] SOFTRESET = 1` and wait for the system reset completion by polling `MMU_SYSSTATUS[0] RESETDONE` until it is equal to 1.
2. Set `MMU_SYSCONFIG[0] AUTOIDLE` bit to enable power saving via automatic interface clock gating. After reset the Table walking logic remain disabled (`MMU_CNTL[2] TWLENABLE = 0`), the TLB is empty and the victim pointer points to the first TLB entry, Entry 0 (`MMU_LOCK[8:4] CURRENTVICTIM` at 0).

To initialize a TLB entry, follow those steps:

3. Load the Virtual Address (VATAG), the preserved (P=1) and valid (V=1) bits and the page size (small or large page, section, supersection) into `MMU_CAM` register.
4. Load the Physical Address (PHYSICALADDRESS), the endianness (ENDIANNESS = 0), element size (ELEMENTSIZE) and mixed page attributes bits (MIXED) into `MMU_RAM` register.
5. Specify the TLB entry you want to write by setting the `MMU_LOCK[8:4] CURRENTVICTIM` pointer. Start with TLB Entry 0 and increment this pointer for each subsequent entry you want to write.
6. Load the specified entry in the TLB by setting `MMU_LD_TLB[0] LDTLBITEM = 1`.
7. Repeat steps 3 to 6 for all entries you want to write.

Remember to increment the `MMU_LOCK[8:4] CURRENTVICTIM` pointer with each entry you are writing. To prevent replacement of TLB entries see [Section 8.4.1.1, Protecting TLB Entries](#).

To enable error handling when more than one valid entry exists in the TLB for the given virtual address or when no translation is found for the virtual address required (with the Table walking logic disabled):

8. Enable Multi-hit fault and TLB miss with table walker disabled interrupts by writing 1 in `MMU_IRQENABLE[4] MULTIHITFAULT` and `MMU_IRQENABLE[0] TLBMISS`.
9. To determine the cause of the fault interrupt the interrupt service routine (ISR) can read corresponding `MMU_IRQSTATUS` bits. The virtual address that caused the fault can be determined by reading `MMU_FAULT_AD`.

NOTE: MMU errors result in a memory stall; the MMU will not process any request until the cause of the error has been addressed.

To enable memory translations enable MMU (virtual addresses are treated as physical addresses when MMU is disabled):

10. Set `MMU_CNTL[1] MMUENABLE = 1` to enable memory translations enable the MMU (virtual addresses are treated as physical addresses when the MMU is disabled).

8.4.1.1 Protecting TLB Entries

The first n TLB entries (with $n <$ total number of TLB entries) can be protected from being overwritten with new translations. This is useful to ensure that certain commonly used or time-critical translations are always in the TLB and do not require retrieval via the table walking process.

The entry protection mechanism is shown in [Figure 8-16](#). To protect the first n TLB entries, set the `MMU1.MMU_LOCK[12:10] BASEVALUE` bit field for the camera MMU (`MMU2.MMU_LOCK[14:10] BASEVALUE` field for the IVA2.2 MMU) to n .

8.4.1.2 Deleting TLB Entries

Two mechanisms exist to delete TLB entries. All unpreserved TLB entries, i.e., TLB entries that were written with the preserved bit set to zero, can be deleted by invoking a TLB flush. Such a TLB flush is invoked by setting the MMUn.MMU_GFLUSH[0] GLOBALFLUSH bit.

Individual TLB entries can be flushed, regardless of the preserved bit setting, by specifying its virtual address in the MMUn.MMU_CAM register and setting the MMUn.MMU_FLUSH_ENTRY[0] FLUSHENTRY bit.

The preserved bit should only be used on protected TLB entries, *as it does not prevent replacement by the table walking logic.*

8.4.1.3 Reading TLB Entries

TLB entries can be read by you to determine the TLB content at runtime. In doing so, the TLB entry number is specified by setting the MMUn.MMU_LOCK[8:4] CURRENTVICTIM pointer. CAM and RAM parts of the TLB entry can then be read in the MMUn.MMU_READ_CAM and MMUn.MMU_READ_RAM registers, respectively.

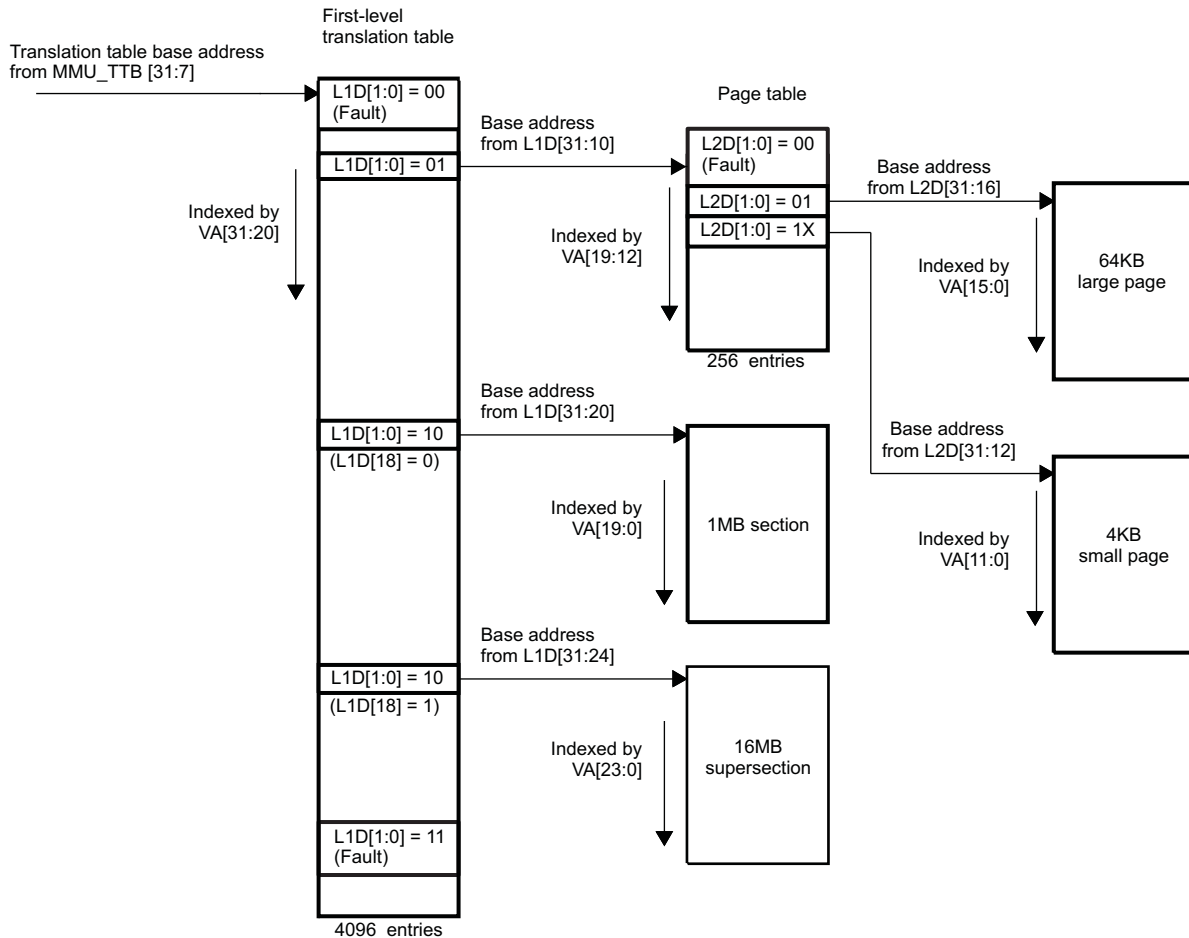

8.4.2 Programming the MMU Dynamically

When translation tables are used for MMU address translation they must be properly set up and the table walking logic must be enabled.

The following page sizes are supported:

- Supersection: 16M bytes
- Section: 1M byte
- Large page: 64K bytes
- Small page: 4K bytes

The memory location of these sections or pages (the Physical Address) is found by reading the Translation Table Hierarchy using a combination of the Virtual Address and the Translation Table Base address. [Figure 8-19](#) illustrates the MMUn translation table hierarchy, with first-level descriptors (L1D) and second-level descriptors (L2D).

Figure 8-19. MMUn Translation Table Hierarchy

MMU-019

The first step is to build translation tables (first- and second-level translation tables depending on translation strategy) and place them into memory.

The start address of translation tables must always be aligned according to their size. For example, a 4096-entry first-level translation table must be aligned on a 16KB boundary (4096 Entries * 4 bytes = 16KB); that is, the lower 14 bits of the translation table start address (`MMUn.MMU_TTB[13:0]`) must be 0. For more details, see [Section 8.3.3.2, First-Level Translation Table](#).

After the translation tables have been written to memory the translation table base address (that is, the most significant bits of the first-level translation table start address) must be set. This is done using the `MMUn.MMU_TTB[31:7]` TTBADDRESS bit field. See [Section 8.5, MMU Register Manual](#), for a complete description of the MMU control registers.

Once the translation tables have been written to memory and the translation table base is set, the table walking logic can be enabled. This is done by setting the `MMUn.MMU_CNTL[2]` TWLENABLE bit.

8.4.2.1 Programming the MMU Using First- and Second-Level Translation Tables

Translation tables must be set up and written in memory. Each TLB entry contains a memory page size: 1MB section or 16MB supersection. When the page size is smaller, 4KB or 64KB, second-level translation tables are necessary. To set up the MMU, follow the same steps as in the previous example but write the first- and second-level descriptors in physical memory.

The first-level translation table describes the translation properties for 1MB sections. To describe a 4-GB address range with 1-MB sections, 4096 32-bit entries (so-called first-level descriptors) are required. The first-level translation table start address must be aligned on a multiple of the table size with a 128-byte

minimum. Consequently, an alignment of at least 16K bytes is required for a complete 4096-entry table (that is, at least the last 14 address bits must be 0). The start address of the first-level translation table is specified by the so-called translation table base. The table is indexed by the upper 12-bits of the virtual address. Figure 8-20 through Figure 8-23 shows how the physical address is built from the virtual address as a function of the page sizes and hierarchy.

8.5 MMU Register Manual

The MMU1 (camera ISP MMU) and MMU2 (IVA2.2 MMU) instances are programmed using two identical sets of configuration registers. [Table 8-8](#) lists the base address of each register set.

Table 8-8. MMU Instance Summary

MMU Instance	Base Address	Size
MMU1 (Camera MMU)	0x480B D400	256 bytes
MMU2 (IVA2.2 MMU)	0x5D00 0000	256 bytes

NOTE: The MPU MMU is configured using register CP15. For more information, see the public ARM Cortex-A8 TRM.

8.5.1 Register Mapping Summary

Each MMU instance (except the MPU MMU) is programmed using a set of 18 configuration registers. [Table 8-9](#) lists these registers and their access type, access size, and offset against their respective base address.

NOTE: The registers and their bit fields in this set are identical for the two instances except the MMUn.MMU_LOCK register, which has bit fields for the MMU1 (camera ISP MMU) that are different from the MMU2 (IVA2.2 MMU).

CAUTION

MMU2 instance (IVA2.2 MMU) registers are limited to 32-bit data accesses. Data access of 16 bits and 8 bits are not allowed and can corrupt register content.

Table 8-9. MMU Register Summary

Register Name	Type	Register Width (Bits)	Address Offset	MMU1 (Camera MMU) Physical Address	MMU2 (IVA2.2 MMU) Physical Address

9.7 SDMA Registers Manual	1010

9.1 SDMA Module Overview

The System Direct Memory Access (SDMA), also called DMA4, performs high-performance data transfers between memories and peripheral devices without microprocessor unit (MPU) support during transfer. A DMA transfer is programmed through a logical DMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

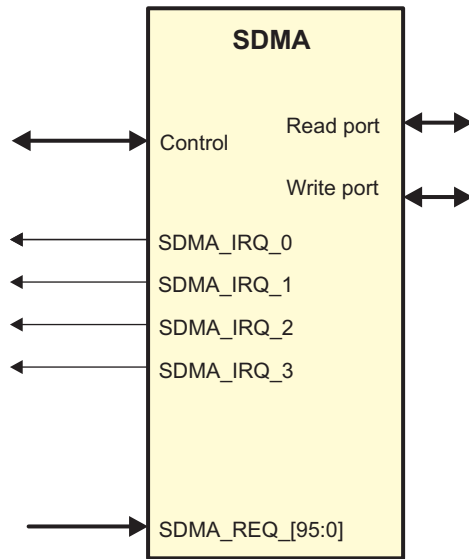

The device also embeds dedicated DMA controllers: the camera image signal processor (ISP) DMA; the enhanced DMA (EDMA), which is embedded in the IVA2.2 subsystem; the display DMA; and the universal serial bus (USB) high-speed (HS) DMA. For more information, see [Chapter 12, Camera ISP Subsystem](#); [Chapter 14, IVA Subsystem](#); [Chapter 15, Display Subsystem](#); and [Chapter 23, High-Speed USB Controllers](#).

The DMA controller includes the following main features:

- Data transfer support in either direction between:
 - Memory and memory
 - Memory and peripheral device
- 32 logical DMA channels supporting:
 - Multiple concurrent transfers
 - Independent transfer profile for each channel
 - 8-bit, 16-bit, or 32-bit data element transfer size
 - Software-triggered or hardware-synchronized transfers
 - Flexible source and destination address generation
 - Burst read and write
 - Chained multiple-channel transfers
 - Endianism conversion
- First-come, first-serve DMA scheduling with fixed priority
- Up to 96 DMA requests
- Constant fill
- Transparent copy
- Four programmable interrupt request output lines
- Software or hardware enabling
- FIFO depth: 256 x 32-bits
- Data buffering
- FIFO budget allocation
- Power-management support
- Auto-idle power-saving support
- Implementation of retention flip-flops (RFFs) to support dynamic power saving (DPS) between system power modes without MPU involvement

[Figure 9-1](#) shows an overview of the SDMA module.

Figure 9-1. SDMA Overview

DMA-001

The SDMA module has two ports—one read and one write—and provides multiple logical channel support. A dynamically allocated FIFO queue memory pool provides buffering between the read and write ports.

The MPU configures the SDMA through the L4 interconnect.

9.2 SDMA Controller Environment

9.2.1 Environment Overview

The read and write ports of the SDMA controller are connected to the device through the L3 interconnect. The control port is connected to the L4 interconnect. The SDMA interrupt lines are connected to the interrupt lines of the MPU interrupt controller. The SDMA can handle up to 96 DMA requests, including four external hardware DMA requests.

9.2.2 SDMA Request Scheme

The hardware DMA request line schemes can be either edge-sensitive or transition-sensitive.

The sensitivity selection of the DMA request line can be configured in the system control module with the following register bits:

- CONTROL.CONTROL_DEVCONF0[0] SENSDMAREQ0 register bit for sys_ndmareq0
- CONTROL.CONTROL_DEVCONF0[1] SENSDMAREQ1 register bit for sys_ndmareq1
- CONTROL.CONTROL_DEVCONF1[7] SENSDMAREQ2 register bit for sys_ndmareq2
- CONTROL.CONTROL_DEVCONF1[8] SENSDMAREQ3 register bit for sys_ndmareq3

The default scheme is transition sensitive. All internal peripherals of the device use the transition-sensitive scheme.

Figure 9-2 shows the DMA request captured on a falling edge in the edge-sensitive scheme.

Figure 9-2. Edge-Sensitive DMA Request Scheme

108-013

For a transition-sensitive DMA request (see Figure 9-3), the line must be maintained low (asserted) until the first DMA access is complete, after which the line must be maintained high (deasserted) for a minimum of one clock cycle (CORE_L3_ICLK):

When the deassertion time is less than one clock cycle, the SDMA might not detect the deassertion.

When the channel is enabled one cycle after a DMA request is disabled, the channel detects the DMA request and starts the corresponding transfer.

When the channel is enabled two cycles after the DMA request is disabled, the channel does not detect the DMA request.

Figure 9-3. Transition-Sensitive DMA Request Scheme

108-012

9.3 SDMA Module Integration

Figure 9-4 highlights the SDMA controller integration.

Figure 9-4. SDMA Controller Integration

dma-002

9.3.1 External SDMA Request Interface Description

The sys_ndmareq pins are optional external DMA requests used by external devices to establish direct hardware synchronization with the SDMA controller. A logical channel can be configured to respond to an external synchronization request. These requests can be configured to either active low on level or falling edge active by the control module.

Table 9-1 shows the I/O description of the external DMA request pin.

Table 9-1. Description External DMA Request Pin

Signal Name	IO	Description	Reset
sys_ndmareq0	I	External DMA request to the SDMA controller	Unknown
sys_ndmareq1	I	External DMA request to the SDMA controller	Unknown
sys_ndmareq2	I	External DMA request to the SDMA controller	Unknown
sys_ndmareq3	I	External DMA request to the SDMA controller	Unknown

Figure 9-5 shows the SDMA environment with an example of how to use the external hardware DMA request pins.

Figure 9-5. Example of External DMA Requests Use to the SDMA Controller

dma-003

For example, an external device can use the external DMA request pins to start a logical channel transfer over the general-purpose memory controller (GPMC) interface. The transfer can be a memory-to-memory transfer in which the source memory is in the external device.

The external DMA request signals are not available on external pins by default after cold reset. See [Chapter 7, System Control Module](#), for instructions on multiplexing out the seven signal lines to pins.

9.3.2 Clocking, Reset, and Power-Management Scheme

9.3.2.1 Clocking

The SDMA controller uses two clock domains:

- CORE_L4_ICLK supports the configuration port.
- CORE_L3_ICLK is both a functional clock for all internal logic and for the two master read and write ports.

The SDMA controller supports a software-controlled standby mode with an input clock shutoff. Setting the PRCM.CM_IDLEST1_CORE[2] ST_DMA status bit to 1 allows detection of the SDMA power mode.

For more information about power management and clock idle, see [Section 9.4.20, Power Management](#).

9.3.2.2 Resets

9.3.2.2.1 Asynchronous Hardware Reset

The SDMA controller is part of the CORE_RST reset domain.

9.3.2.2.2 Software Reset Through the Configuration Port

The SDMA controller can be reset independently by software through the SDMA.DMA4_OCP_SYSCONFIG[1] SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset.

Hardware and software resets initialize all of the logic in the SDMA module and the global registers and some of the per-channel registers (such as the enable bit hardware request line number and link bit field) implemented in flip-flops. However, all remaining per-channel registers are memory-based and, therefore, are not reset.

9.3.2.3 Power Domain

The SDMA controller is part of the CORE power domain.

9.3.3 Hardware Requests

9.3.3.1 Interrupts to the MPU Subsystem

DMA4 has four interrupt lines, numbered L_j with $j=0..3$. Each logical channel can request an interrupt over any line. The attachment of a channel interrupt event to one of these four external lines is programmable. The software determines whether it attaches a channel interrupt to a single IRQ line or to multiple IRQ lines.

There are two different registers per interrupt line:

- SDMA.DMA4_IRQSTATUS_Lj CH_31_0_Lj field shows the status of the different sources of interrupt. If the SDMA.DMA4_IRQENABLE_Lj bit i is 1, the channel i is the source of interrupt in line j . In contrast to the SDMA.DMA4_CSRi registers, the SDMA.DMA4_IRQSTATUS_Lj registers are updated regardless of the corresponding bits in the SDMA.DMA4_IRQENABLE_Lj registers.
- SDMA.DMA4_IRQENABLE_Lj CH_31_0_Lj_EN field masks/unmasks the channel interrupt. If the SDMA.DMA4_IRQENABLE_Lj bit i is set to 0, the channel interrupt i of the line j is masked.

Each logical channel can generate 10 different interrupt events when enabled (that is, set to 1) in the SDMA.DMA4_CICRi register. Each status bit is updated in the SDMA.DMA4_CSRi register only when the corresponding enable bit is enabled in the SDMA.DMA4_CICRi register.

To determine an interrupt source when an interrupt rises on an interrupt line L_j , you must:

- Identify the channel (LCH_i) generating the interrupt.
Read the SDMA.DMA4_IRQSTATUS_Lj.LCHi (LCH0 to LCH31). If $LCH_i = 1$, channel i is the originator of the interrupt.
- Identify the interrupt event.
Read the LCH_i SDMA.DMA4_CSRi. For example, if the drop event (the SDMA.DMA4_CSRi[1] DROP bit) is 1, there will be a request collision.
The interrupt event status bit in the SDMA.DMA4_CSRi register is immediately reset after it is written to 1.
The interrupt status bit in the SDMA.DMA4_IRQSTATUS_Lj register is cleared after it is written to 1.

Table 9-2 shows how the SDMA module interrupt lines are connected to the interrupt lines of the MPU interrupt controller.

Table 9-2. SDMA Interrupt Mapping to the MPU Subsystem

IRQ	Source	Description
M_IRQ_12	SDMA_IRQ_0	SDMA interrupt request 0
M_IRQ_13	SDMA_IRQ_1	SDMA interrupt request 1
M_IRQ_14	SDMA_IRQ_2	SDMA interrupt request 2
M_IRQ_15	SDMA_IRQ_3	SDMA interrupt request 3

9.3.3.2 DMA Requests to the SDMA Controller

This section gives information about all modules and features in the high-tier device. See [Section 1.5, Device Family](#), to check availability of modules and features. Ensure that DMA requests of unavailable modules and features are masked in DMA subsystems.

All peripherals internal to the device use the transition-sensitive scheme for DMA requests. For more information on the transition-sensitive scheme, see [Section 9.2.2, SDMA Request Scheme](#). [Table 9-3](#) lists the SDMA request mapping.

Table 9-3. SDMA Request Mapping

9.4 SDMA Functional Description

The SDMA module provides high-performance data transfers between memories and peripheral devices with low processor use. A DMA transfer is programmed through a logical DMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

Figure 9-6 shows the SDMA controller top-level block diagram.

Figure 9-6. SDMA Controller Top-Level Block Diagram

108-005

9.4.1 Logical Channel Transfer Overview

As Figure 9-6 shows, the SDMA module has one read port and one write port operating independently of each other. Buffering is provided between the read and write ports through a FIFO queue memory pool that is shared dynamically between the active logical channels.

- Logical channel synchronization
A logical channel is described as hardware-synchronized when the DMA transfers are triggered by DMA requests from a hardware device. Alternatively, a logical channel is described as nonsynchronized when the DMA transfer is triggered by software.
- Logical channel activation
A logical channel becomes active as follows:

- For hardware-synchronized transfers, when the logical channel is enabled and the hardware DMA request line is asserted
- For software-triggered (nonsynchronized) transfers, as soon as software enables the logical channel
- Logical channel transfer composition

A DMA transfer is divided automatically into a number of transactions. Depending on the logical channel context configured, transfer size, the start address alignment, the addressing mode, and the configured maximum burst size, each transaction can be either a single access or a burst of accesses.
- Logical channel scheduling

When several logical channels are active at the same time, schedulers manage the read and write ports. The scheduling of logical channel transfers is similar for both read and write ports. When a logical channel becomes active, it is added to the tail of a scheduling queue. If more than one logical channel becomes active at the same time, the one with the lower number is queued first. This mechanism provides a first-come, first-serve scheduling scheme between the concurrently active logical channels.

In addition, each read and write port has a high-priority queue and a low-priority queue. The priority bit in the logical channel `SDMA.DMA4_CCRi` register determines if a logical channel is queued as high or low priority. The relative weighting of the scheduling of the high-priority queue to the low priority queue is programmable from 1:1 to 1:256 through the DMA global channel register (`SDMA.DMA4_GCR`).

NOTE: The `SDMA.DMA4_GCR[23:16] ARBITRATION_RATE` field is not dependent on the `SDMA.DMA4_GCR[13:12] HI_THREAD_RESERVED` field. The `ARBITRATION_RATE` field is dependent on the `SDMA.DMA4_CCRi[26] WRITE_PRIORITY` bit and the `SDMA.DMA4_CCRi[6] READ_PRIORITY` bit.

- Read/write port access scheduling policy

When either the read or write port becomes available, the port access scheduler selects the next logical channel for which to perform a DMA transaction from either the high- or low-priority queue. When the current DMA transaction (single or burst access) is complete and the full DMA transfer is not finished, the logical channel returns to the tail of the queue. Because the port access scheduling is on a per-transaction basis, a logical channel can be queued repeatedly this way several times during a single transfer.

The SDMA module can have up to four outstanding read transactions and two outstanding write transactions in the system interconnect; four read and two write thread IDs exist. For an arbitration cycle to occur, these two conditions must be met:

- At least one channel is requesting.
- At least one free thread ID is available.

On an arbitration cycle, the scheduler grants the highest priority channel that has an active request, allocates the thread ID, and tags this thread as busy. At a given time, a channel cannot be allocated for more than one thread ID.

NOTE: If more than one channel is active, each channel is given a thread ID for the current service only, not for the whole channel transfer.

When only one channel is active, one thread ID is allocated during the channel transfer. The access can be up to a 16 x 32-bit access (that is, 16 32-bit single access, four bursts of 16bytes, two bursts of 32bytes, or one burst of 64bytes) without rescheduling the channel at the end of each burst transfer.

When nonburst alignment is at the beginning of the transfer, the channel is rescheduled for each smaller access until burst-aligned. When the end of the transfer is not burst-aligned, the channel is rescheduled for each of the remaining smaller accesses.

For a logical channel transfer completion, when the last access is written to the destination, the logical channel becomes inactive. If enabled, an interrupt request is generated (see [Section 9.4.12, Interrupt Generation](#)).

9.4.2 FIFO Queue Memory Pool

A FIFO queue memory pool provides buffering between the read and write ports. The hardware allocates the space dynamically to a number of FIFO queues, and each queue is associated with an active logical channel.

To avoid a memory pool overflow, if there are fewer entries in the FIFO queue memory pool than are required for the maximum configured source burst size of the next logical channel to be scheduled, the logical channel is returned to the tail of the queue, and the port access scheduler continues to search the queue until it finds a logical channel that can be scheduled.

The maximum FIFO depth that can be allocated to each individual logical channel can be limited globally through the `SDMA.DMA4_GCR` register. This value should be configured to allow a fair allocation of the memory pool between the active channels.

A logical channel is scheduled if it has not yet reached its allocation limit, even if the access to be performed will exceed this limit. This means that the effective number of entries used by a particular logical channel is limited to the configured maximum entries per channel + channel maximum configured burst size (in words) - 1.

9.4.3 Addressing Modes

A DMA transfer block consists of a number of frames (FN). Each frame consists of a number of elements, and each element can have a size of 8, 16, or 32 bits, as follows:

transfer block size = number of frames x number of elements per frame x element size

The FN, number of elements per frame (EN), and size of elements are common for both the source and destination. However, the way in which the data is represented (addressing profile/mode) is independently programmable for the source and destination devices, using one of these four addressing modes:

- Constant: The address remains the same for consecutive element accesses.
- Post-increment: The address increases by the element size (ES), even across consecutive frames.
- Single-index: The address increases by the ES, plus the element index (EI) value minus one (even across consecutive frames).
- Double-index: The address increases by the ES, plus the EI value minus one within a frame. When a full frame is transferred, the address increases by the ES plus the frame index (FI) value minus 1.

The ES, EI, and FI values are expressed in bytes. The EI and FI values can be positive or negative.

When calculating the EI and FI values, it is critical to note that, after an element is accessed, the logical channel address pointer equals the address of the last byte (highest address) of the accessed element. The correct value for the EI or FI should be such that, when added to the logical channel address pointer, results in the address of the first byte (lowest address) of the next element to be accessed.

The EI and FI values must be configured so that the address of each element in the transfer is aligned on an ES boundary.

Consequently, the single-index addressing mode with EI = 1 or double-index addressing mode with EI = 1 and FI = 1 is equivalent to post-increment addressing.

NOTE: The source and destination start addresses must also be aligned on an ES boundary.

When the address of an element to be accessed is not aligned on an ES boundary, the transfer is stopped and an address error interrupt occurs, if enabled (see [Section 9.4.12, Interrupt Generation](#)).

The `SDMA.DMA4_CFNi` register configures the FN in a block.

The `SDMA.DMA4_CENi` register configures the EN.

The `SDMA.DMA4_CSDPi` register configures the ES.

The `SDMA.DMA4_CSSAi` and `SDMA.DMA4_CDSAi` registers configure the source and destination start addresses.

The `SDMA.DMA4_CCRi` register configures the source and destination addressing modes.

The SDMA.DMA4_CSEi, SDMA.DMA4_CSFi, SDMA.DMA4_CDEi, and SDMA.DMA4_CDFi registers configure the source EI, source FI, destination EI, and destination FI, respectively.

The addressing profiles are expressed as equations as follows:

Equation 1. Constant addressing:

$$A(n+1) = A(n)$$

Equation 2. Post-increment addressing:

$$A(n+1) = A(n) + ES$$

Equation 3. Single-indexed addressing:

$$A(n+1) = A(n) + ES + (EI - 1)$$

Equation 4. Double-indexed addressing:

When not at the end of a frame or transfer (that is, when the element counter $\neq 0$):

$$A(n+1) = A(n) + ES + (EI - 1)$$

When at the end of a frame but not at the end of the transfer (that is, when the element counter = 0 and the frame counter $\neq 0$):

$$A(n+1) = A(n) + ES + (FI - 1)$$

Calculate the element and frame index as follows:

Equation 5. Element index

$$EI = [(Stride EI - 1) * ES] + 1$$

Equation 6. Frame index

$$FI = [(Stride FI - 1) * ES] + 1$$

where:

A(n): Byte address of the element n within the transfer.

ES is in bytes, $ES \in \{1, 2, 4\}$.

EI is in bytes, specified in a configuration register, $-32768 \leq EI \leq 32767$.

Stride EI: The difference in the number of elements between the start of the current element, n, to the start of next element, n+1.

Element counter: A counter that is (re)initiated with the number of elements per frame or per transfer. Decreased by 1 for each element transferred. The initial value is configured in the register DMA channel element number, SDMA.DMA4_CENi.

F is in bytes, specified in a configuration register, $-2147483648 \leq FI \leq 2147483647$.

Stride FI: The difference in the number of elements between the start of the last element of the current frame and the beginning of the first element of the next frame.

Frame counter: A counter that is (re)initiated with the FN per transfer. Decreased by 1 for each frame transferred. The initial value is configured in the register DMA channel frame number, SDMA.DMA4_CFNi.

Figure 9-7 shows how a stride EI and FI are defined. When handling complex configurations, using strides can make it easier to calculate EI and FI because you can calculate in elements instead of bytes. (This approach is used in the 90Degrees clockwise image rotation example shown in Figure 9-11.) The double-index addressing example shown in Figure 9-7 has ES = 4, EN = 2, EI = 5, FI = 5, and FN = 2.

Figure 9-7 through Figure 9-10 show examples of addressing mode configurations. Table 9-4 lists parameter values for the examples.

Figure 9-7. Example Showing Double-Index Addressing, Elements, Frames, and Strides

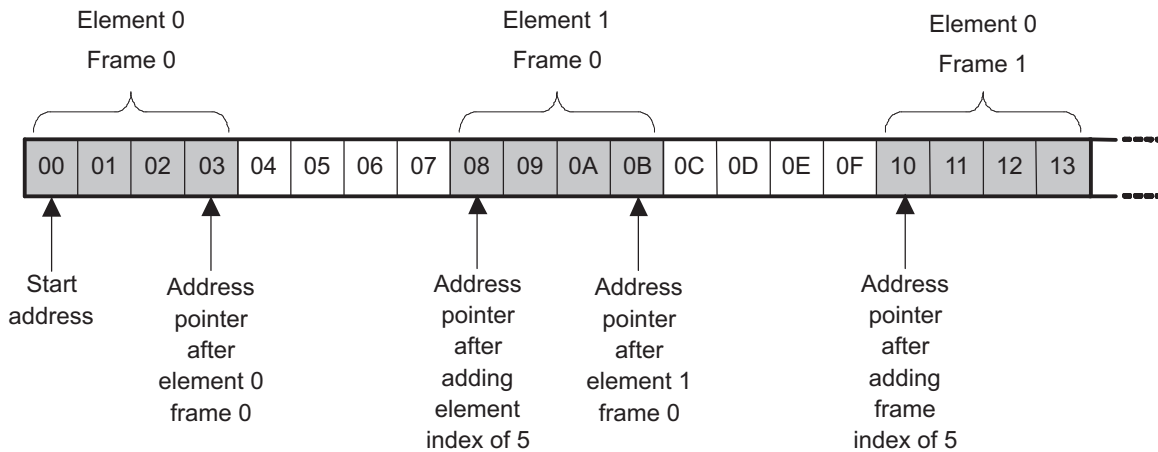

108-011

Figure 9-8. Addressing Mode Example (a)

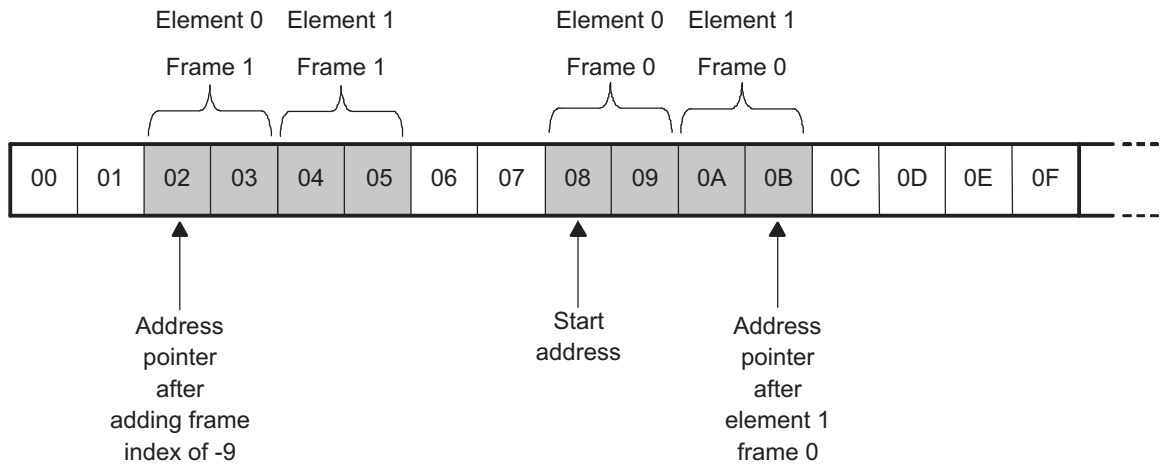

108-010

Figure 9-9. Addressing Mode Example (b)

108-009

Figure 9-10. Addressing Mode Example (c)

108-008

Table 9-4. Parameter Values for Addressing Mode Examples (a), (b), and (c)

Parameter	Example (a)	Example (b)	Example (c)
Addressing mode	Single index (or post-increment)	Double index	Double index
Start address	0	0	8
ES	4 (32-bit)	4 (32-bit)	2 (16-bit)
EN	3	2	2
EI	1	5	1
FN	1	2	2
Frame index	N/A	5	-9

Double indexing can occur either on source (read) or destination (write). Equations for rotation of xx degrees on destination are obtained by taking equations for rotation of $(360-xx)$ degrees on source, and swapping x and y in them. The opposite is also true. Table 9-5 list the equations for rotation for 90, 180 and 270°.

Table 9-5. Equations for Rotation

		90° Rotation	180° Rotation	270° Rotation
Double indexing on destination (write)	Base address	$ES*(y-1)$	$ES*(x*y-1)$	$ES*y*(x-1)$
	Element index (EI)	$ES*(y-1)+1$	$1-2*ES$	$1-ES*(y+1)$
	Frame index (FI)	$1 - ES*[(x-1)*y+2]$	$1-2*ES$	$1+ES*(x-1)*y$
Double indexing on source (read)	Base address	$ES*x*(y-1)$	$ES*(x*y-1)$	$ES*(x-1)$
	Element index (EI)	$1-ES*(x+1)$	$1-2*ES$	$ES*(x-1)+1$
	Frame index (FI)	$1+ES*(y-1)*x$	$1-2*ES$	$1 - ES*[(y-1)*x+2]$

Table 9-6 and Figure 9-11 show the configuration required to perform a 90° clockwise image rotation of a 240 x 160 pixel, 32-bit image. The EI, frame size, and FI values are configured so that the image is rotated line by line starting at the left-hand end of the top line.

NOTE: The FI value for the destination is negative so that the first pixel of each subsequent line of the source image is written to the correct location at the destination.

Equation 5 and Equation 6 calculate the destination FI and EI. The example assumes that the image lines are stored at consecutive addresses in memory, meaning that both EI and FI on the source side are 1.

Rotations:

Section 9.5.7, 90° Clockwise Image Rotation, describes how to program this example.

Observe that:

- One pixel = one element
- One line = one DMA frame
- Pixel size = element size = ES

Table 9-6. Example Parameter Values for a 90° Clockwise Image Rotation

Parameter	Source Value	Destination Value
Bits per pixel	32	32
ES	4	4
Image width	SW	SH
Image height	SH	SW
Stride elements (stride EI)	1 element	SH
Stride frames (stride FI)	1 element	$-[(SW-1)*SH+1] = -38241$ elements
Start address	0x100000	$0x200000 + (SH - 1) \times ES = 0x20027C$
EN	SW	SW
EI	$[(Stride EI - 1) * ES] + 1 = 1$	$[(Stride EI - 1) * ES] + 1 = 637$
FN	SH	SH
FI	$[(Stride FI - 1) * ES] + 1 = 1$	$[(Stride FI - 1) * ES] + 1 = -152967$

Figure 9-11. Example of a 90° Clockwise Image Rotation

9.4.4 Packed Accesses

When the logical channel ES is less than the DMA module read/write port size, and the addressing profile supports it (that is, post-increment mode or single- or double-index mode with EI = 1), the number of elements to transfer in each read/write port access may be maximized by specifying that the source or destination is packed through the channel SDMA.DMA4_CSDPi register. Thus:

- For a read/write port size of 32 bits, the source or destination can be configured as packed for transfer ESs of 8 bits (four elements per access) and 16 bits (two elements per access).
- For a read/write port size of 64 bits, the source or destination can be configured as packed for transfer ESs of 8 bits (eight elements per access), 16 bits (four elements per access), and 32 bits (two elements per access).

Depending on the start address and transfer length, the first or last packed access might be only partially filled. This is indicated to the source or destination using the byte-enable signals.

NOTE: When a constant addressing mode is specified, only nonpacked accesses are used, and specifying the accesses as packed has no effect.

9.4.5 Burst Transactions

Transfer performance can be improved, where the source or destination and addressing profile supports it, by configuring the logical channel to perform burst transactions consisting of multiple instead of single accesses. The channel can be programmed to use burst sizes equivalent to 16, 32, or 64 bytes through the `SDMA.DMA4_CSDPi` register, with the read burst size being programmable independently of the write burst size. Typically, the optimal burst size is 64 bytes (16 accesses for a 32-bit read/write port size or 8 accesses for a 64-bit read/write port size).

To obtain the maximum benefit from burst transactions, the source and destination start addresses should be aligned with the burst size. If this is not the case, the start of the transfer can consist of a number of smaller (single or burst) transactions until the first burst size boundary is reached.

Similarly, if the end of the transfer is not aligned on a burst size boundary, the final part of the transfer can consist of a number of smaller transactions.

NOTE: Except in the constant addressing mode, the source or destination must be specified as packed for burst transactions to occur.

9.4.6 Endianism Conversion

The source and destination are each specified as little-endian or big-endian through the `SDMA.DMA4_CSDPi` register for the particular logical channel. If the endianism of the source and destination differ, and the logical channel ES is less than the SDMA module read/write port size, an endianism conversion is applied to the data before it is written to the destination.

When transferring data between a source and a destination with different endianism, it is important to specify an ES that is equal to the type of data being transferred to preserve the correct data image at the destination.

In the system, endianism conversion can be performed in more than one place. It is possible to inform the source and/or destination to lock the endianism (that is, to not perform a conversion) through the logical DMA channel `SDMA.DMA4_CSDPi` register.

9.4.7 Transfer Synchronization

A logical channel can be programmed for either software-triggered or hardware synchronized transfers.

9.4.7.1 Software Synchronization

A transfer is software-triggered when the logical channel is set up and started by software. To specify a software-triggered transfer, set the channel DMA register bits `SDMA.DMA4_CCRi[4:0]` and `SDMA.DMA4_CCRi[20:19]` to 0. The transfer starts as soon as the DMA register bit `SDMA.DMA4_CCRi[7]` is set (that is, enters the scheduling process).

9.4.7.2 Hardware Synchronization

A transfer is hardware-synchronized if the logical channel activation is driven by hardware requests from either the source or destination target. A hardware synchronized transfer is specified by configuring the DMA request line number in the channel `SDMA.DMA4_CCRi` register to a value that corresponds to the DMA request line from the source or destination that generates the DMA requests. The DMA request numbers to be configured are specified in the DMA request mapping (see [Table 9-8](#)).

Specify the DMA request number in the channel DMA register bits `SDMA.DMA4_CCRi[4:0]` and `SDMA.DMA4_CCRi[20:19]`. After the DMA register bit `SDMA.DMA4_CCRi[7]` is set, the logical channel becomes enabled but not activated (that is, it does not enter the scheduling process), which means that channel registers are not updated until the first DMA request is received.

NOTE: DMA Request Line

A DMA request line must not be shared between concurrently enabled DMA channels. However, a DMA request line can be shared between several chained logical channels.

The channel synchronization control registers are 1-based. For example, to enable the `S_DMA_1` request, `SDMA.DMA4_CCRi[4:0]` `SYNCHRO_CONTROL` must be set to `0x2` (DMA request number + 1).

For hardware synchronization, the amount of data to be transferred for each assertion of the DMA request line is configured through the frame synchronization (FS) and block synchronization (BS) bits in the logical channel `SDMA.DMA4_CCRi` register and the DMA register bits `SDMA.DMA4_CCRi[5]` and `SDMA.DMA4_CCRi[18]`, respectively.

The amount of data can be any of the following:

- A single element transfer: A complete element defined by `Data_type`. For example, 8/16/32 bits are transferred in response to a DMA request.
- A full frame: A complete frame of several elements is transferred in response to a DMA request.
- A full block (a full channel transfer): A complete block of several frames is transferred in response to a DMA request.
- A full packet (a full channel transfer): A complete packet of several elements is transferred in response to a DMA request.

Packets allow the size of each part of the full DMA transfer to be configured independent of the organization of the data to be transferred (typically a number of elements). This can be useful when the source or destination has a buffer (such as a FIFO queue) with a size unrelated to the frame size of the transfer. The packet size then can be set to the size of the buffer.

Packet transfer must be used only where the source or destination is addressed in constant addressing mode, because FI registers are reused to specify size of the packet.

To support the burst mode, the logical channel must also be configured to use the source-port packed access mode. The packed address mode cannot be used with a constant address mode: it must be configured to use a post-increment address mode.

The packet size is configured based on the source/destination synchronization select bit in the `SDMA.DMA4_CCRi` register through either the channel `SDMA.DMA4_CDFi` register (source synchronized) or the `SDMA.DMA4_CSFi` register (destination synchronized).

When the logical channel transfer block is not an exact multiple of the packet size, the final packet consists of the remaining elements in the transfer, using burst or single accesses to complete the block transfer.

The maximum transfer size, regardless of the packet size, is always as follows:

$$\text{Block_size} = \text{Number_of_Frame_in_Block} * \text{Number_of_Element_in_Frame} * \text{Element_Size}$$

- Synchronized at the source

The DMA module optimizes the transfer with respect to the number and size of burst transactions for the given source and destination addressing profiles and configured maximum burst sizes. When writing to the destination is slower than reading from the source, data is buffered in the channel FIFO queue. If the transfer is packet-synchronized at the source, the end-of-packet interrupt is disabled (see [Section 9.4.11, Reprogramming an Active Channel](#)).

For a source synchronized transfer, buffering can be enabled or disabled by setting the `SDMA.DMA4_CCRi[25]` `BUFFERING_DISABLE` bit. For a packet source synchronization with buffering disabled and the packed/burst across the packet boundary, the last packed/burst write transaction is split in optimized smaller accesses to complete the packet transfer size. However, for a packet source synchronized transfer with buffering enabled and with the packed/burst across the packet boundary, the DMA module waits for the next DMA request(s) to read enough data to issue an atomic

packed/burst write transaction (assuming the address is packed/burst aligned).

NOTE: Regardless of whether buffering is enabled or not, buffering is not performed between frames. If the packed/burst is across the frame boundary, the last packed/burst write transaction is split into optimized smaller accesses to complete the frame transfer size.

- Synchronized at the destination

The performance of a hardware-synchronized transfer can be improved by using the prefetch mode, enabled through the channel DMA register bit SDMA.DMA4_CCRi[23]. Data is prefetched on the read port side in advance of the DMA request received and buffered in the FIFO queue. Up to a full transfer block can be prefetched, although this can be limited by the specified maximum channel FIFO queue depth (see [Section 9.4.2, FIFO Queue Memory Pool](#)).

Buffering disable is not allowed for a destination-synchronized transfer.

NOTE: Behavior is undefined when prefetch is enabled and a transfer is synchronized to the source.

Whether buffering is enabled or disabled, the last transaction in the frame or in the block is write nonposted (WNP) even if the write mode is specified as write last nonposted (WLNP; the WRITE_MODE bit field of the SDMA.DMA4_CSDPi register = 0x2). However, in a packet synchronization mode, the last transaction of each packet in the transfer is WNP only if buffering disable is on (even if the write mode is specified as WLNP).

Regardless of whether buffering disable is enabled or disabled, the packet interrupt is not generated in the packet source synchronized mode.

CAUTION

The BUFFERING_DISABLE bit field of the SDMA.DMA4_CCRi register must be filled with an allowed value, as specified in [Table 9-7](#).

Table 9-7. Buffering Disable

	BUFFERING_DISABLE (0: buffering enable, 1: buffering disable)	
Destination synchronized	0	Allowed
	1	Not allowed
Source synchronized	0	Allowed
	1	Allowed

Synchronized transfer monitoring using CDAC (SDMA.DMA4_CDACi):

Context is restored only when the channel becomes active on a DMA request (not at software enable). The channel is software-enabled first, and then a DMA request is asserted followed by the first context restore.

The CDAC register is writable; thus, you can initialize the CDAC to monitor the transfer and determine if the transfer is started or not (see [Section 9.5.4, Synchronized Transfer Monitoring Using CDAC](#), for more information).

NOTE: The CDAC register must be written or read so that the least-significant byte (LSByte) is read first; otherwise, the shadow registers do not update the CDAC registers.

This is not an issue for 32-bit read-write transactions. Nevertheless, for 16-bit transactions, start reading or writing the LSByte first to enable the register update.

9.4.8 Thread Budget Allocation

When several concurrent channels are latency critical and hardware synchronized, a specific latency cannot be ensured until the target is served. This situation occurs when the concurrent channel number is superior to the number of available threads.

NOTE: Four threads are available on the read port, and two threads are available on the write port.

For a hardware-synchronized transfer (memory to peripheral), a minimum bandwidth for a latency-critical transfer must be ensured to avoid collisions between two hardware requests.

Because it is latency critical, the software user is responsible for the following:

- Programming the synchronized channel as a high-priority channel
- Reserving one or several threads for high-priority channels

The proposed implementation is as follows (see [Section 9.5.5](#)):

Prevent the regular channel queue from exceeding more than a programmable (3, 2, or 1) number of threads on the read port and no more than one thread on the write port. This number can be set on the global register `SDMA.DMA4_GCR[13:12]`.

The thread reservation is programmable for maximum use of thread resources for concurrent, low-priority channel transfer. Programmability can also allow a partial throughput control by limiting in software the number of concurrent outstanding requests that break the pipelining.

Depending on the `SDMA.DMA4_GCR [13:12]` value, the following threadID on the read/write ports are allocated for a high-priority channel:

Read port priority thread reservation:

- `SDMA.DMA4_GCR[13:12] = 0x0` => No ThreadID is allocated for high-priority channels.
- `SDMA.DMA4_GCR[13:12] = 0x1` => Read ThreadID 0 is allocated for high-priority channels.
- `SDMA.DMA4_GCR[13:12] = 0x2` => Read ThreadID 0 and Read ThreadID 1 are allocated for high-priority channels.
- `SDMA.DMA4_GCR[13:12] = 0x3` => Read ThreadID 0, Read ThreadID 1, and Read ThreadID 2 are allocated for high-priority channels.

Write port priority thread reservation:

- `SDMA.DMA4_GCR[13:12] = 0x0` => No ThreadID is allocated for high-priority channels
- `SDMA.DMA4_GCR[13:12] = 0x1` => Write ThreadID 0 is allocated for high-priority channels.
- `SDMA.DMA4_GCR[13:12] = 0x2` => Write ThreadID 0 is allocated for high-priority channels.
- `SDMA.DMA4_GCR[13:12] = 0x3` => Write ThreadID 0 is allocated for high-priority channels.

Regardless whether or not the enabled channels are of high priority, only the setting of the `SDMA.DMA4_GCR[13:12]` value forces the thread reservation to these values. Set the appropriate value to avoid losing threads using only regular channels.

To have an independent read and write priority context, a per-channel bit `SDMA.DMA4_CCRi[26]` is added for write priority, and the previous priority bit becomes read priority bit `SDMA.DMA4_CCRi[6]`.

NOTE: The device has one priority bit per logical channel, not one per port.

9.4.9 FIFO Budget Allocation

To avoid fully occupying the FIFO with a high-priority transfer while low-priority channels wait in the arbitration queue, two separate FIFO budgets are specified: one for high-priority channels and one for low-priority channels. This is defined in the `SDMA.DMA4_GCR` register, allowing the user to share the FIFO budget between the low- and high-priority channels. The amount of the FIFO allocated by the low- and high-priority channels is fixed by the value set in the `SDMA.DMA4_GCR[15:14]`

`HI_LO_FIFO_BUDGET` field. The maximum channel FIFO depth is limited by the `HI_LO_FIFO_BUDGET` field as follows:

If the channel is low priority:

- When HI_LO_FIFO_BUDGET = 0x1, then low priority cannot exceed 75 percent of the total FIFO.
- When HI_LO_FIFO_BUDGET = 0x2, then low priority cannot exceed 25 percent of the total FIFO.
- When HI_LO_FIFO_BUDGET = 0x3, then low priority cannot exceed 50 percent of the total FIFO.

If channel is high priority

- When HI_LO_FIFO_BUDGET = 0x1, then high priority cannot exceed 25 percent of the total FIFO.
- When HI_LO_FIFO_BUDGET = 0x2, then high priority cannot exceed 75 percent of the total FIFO.
- When HI_LO_FIFO_BUDGET = 0x3, then high priority cannot exceed 50 percent of the total FIFO.

The user is responsible for performing the following equation:

- For a high-priority channel: $(\text{Per_Channel_Maximum FIFO Depth} + 1) \times \text{Number of High Channel} \leq \text{High Budget FIFO}$
- For a low-priority channel: $(\text{Per_Channel_Maximum FIFO Depth} + 1) \times \text{Number of Low Channel} \leq \text{Low Budget FIFO}$

NOTE: Ensure that *Number of High Channel* means *Number of Active High-Priority Channel* and that *Number of Low Channel* means *Number of Active Low-Priority Channel*.

9.4.10 Chained Logical Channel Transfers

Chaining multiple logical channels permits transfers consisting of multiple parts to be executed without repeated software intervention. This results in better performance than the alternative of software setting up and starting each transfer separately. Each part of a chained transfer can have the data addressed in a different manner that permits the programming of a variety of complex transfers. For example:

- Interlaced video data with one logical channel configured to transfer the even lines and another logical channel configured to transfer the odd lines
- Protocol headers with a separate DMA4 channel configured to transfer each field in the header

Channels can be chained through each channel SDMA.DMA4_CLNK_CTRLi register. When the transfer for the first channel completes, the next channel in the chain is enabled. The number of channels in the chain that are configured for hardware-synchronized transfers is flexible (although typically it might be all, none, or just the first one). The DMA request line number should be set to 0 to specify that any or all of the channels in a chain are software-triggered or nonsynchronized.

The last channel in a chain can be chained to the first channel to create a continuously looping chain. The continuously looping transfer can be stopped on the fly at a specific channel by disabling the SDMA.DMA4_CLNK_CTRLi[15] ENABLE_LNK bit. The looping transfer stops after the specified channel transfer is complete.

NOTE: DMA Request Line

A DMA request line must not be shared between concurrently enabled DMA channels. However, a DMA request line can be shared between several chained logical channels.

For more information on the programming model, see [Section 9.5, SDMA Basic Programming Model](#).

9.4.11 Reprogramming an Active Channel

A currently active logical DMA channel can be disabled through the SDMA.DMA4_CCRi[7] ENABLE bit. When any ongoing transaction is complete and the read-active and write-active bits in the SDMA.DMA4_CCRi register (SDMA.DMA4_CCRi[9] RD_ACTIVE and SDMA.DMA4_CCRi[10] WR_ACTIVE) are reset, the channel can be reprogrammed for a new transfer.

9.4.12 Interrupt Generation

The SDMA module has four interrupt request output lines, SDMA_IRQ_0 to SDMA_IRQ_3. One or more logical channels can be programmed to generate an interrupt request on any of these lines when any one of the maskable DMA events listed in [Table 9-8](#) occurs.

Table 9-8. Logical DMA Channel Events

Event	Description
End of packet	A packet transfer completed.
End of block	A block transfer completed.
End of frame	A frame transfer completed.
Half of frame	Half of the current frame transferred.
Start of last frame	The first element of the last frame transferred.
Transaction error	A transaction error returned by the interconnect in either the read or write port.
Address error	An attempt was made to perform a DMA access to an address not aligned on an ES boundary.
Supervisor transaction error	An error occurred, for example, when an unauthorized initiator (that is not a supervisor) tries to use a supervisor transfer.
Synchronization error	A new DMA request arrived before completion of the transfer because of the previous DMA request.
Drain end	Drain is completed (SDMA.DMA4_CCRi[10] WR_ACTIVE becomes 0).
System transaction error	An error has occurred, for example, when an unauthorized initiator tries to set a normal channel to a System channel or tries to change a System channel to a normal channel or tries to access (write) any register of a System channel registers.
Drop error	A drop event interrupt is generated when a DMA request is being serviced while a second one is asserted and a third one arrives before the second DMA request is serviced.

The logical DMA channels that generate an interrupt on a particular IRQ output are specified through the SDMA.DMA4_IRQENABLE_Lj register (where *l* is the IRQ number: 0, 1, 2, or 3). The events that generate an interrupt for a particular channel can be configured through the channel SDMA.DMA4_CICRi register.

When an interrupt is detected, the logical DMA channel generating the event can first be identified by reading the SDMA.DMA4_IRQSTATUS_Lj register. The event causing the interrupt then can be identified by reading the interrupt status via the relevant DMA channel SDMA.DMA4_CSRi register.

9.4.13 Packet Synchronization

A packet transfer notion is related to the behavior of some peripheral, which have certain buffering capability and requires to transfer the buffer content once an element number threshold is reached (a hardware DMA request is generated). To associate a frame synchronization to each DMA request is possible, but this limits the maximum transfer size. Indeed the maximum transfer size is proportional to the FIFO depth of the peripheral:

$$\text{maximum_transfer_size} = \text{peripheral_FIFO_depth} \times \text{number_of_frame_in_block}.$$

The packet synchronization allows to dissociate the transfer size from the FIFO depth of the peripheral. Only Constant addressing mode is allowed on RD port or WR port if source target or destination target is packet synchronized respectively.

Example:

Let's consider a camera interface, which have a FIFO_depth of 128 Words and a FIFO_element_number_threshold of 128 and a picture to transfer with a size 320 lines per 240 columns. If frame synchronization is associated to each DMA request then the maximum transfer size that can be performed is 128×2^{16} words. In this case, a frame is 128 words long, which does not fit the size of a line. Then it's not possible to generate an interrupt at the end of line. However with introducing the packet transfer notion, which is related to the peripheral FIFO behavior/structure, the maximum transfer size (maximum_transfer_size = $2^{24} \times 2^{16}$ words) is independent of both peripheral_FIFO_depth and FIFO_element_number_threshold. This allows, making an enough long transfer within one channel context and perform rotation operation on big image format.

The main features of DMA Packet transfer are as follows:

- DMA Packet Data Size for each DMA Request: typically this will be Peripheral_element_number_threshold Number of elements in a packet shares the SDMA.DMA4_CSFli and SDMA.DMA4_CDFli configuration registers. Indeed if the peripheral is the source target, respectively destination target, that means the used addressing mode is constant, consequently SDMA.DMA4_CSFli[15:0], respectively SDMA.DMA4_CDFli[15:0], is used to specify the packet data size (PKT_ELNT_NBR) and the bit fields [31:16] are unused. To specify the Packet data size in the SDMA.DMA4_CSFli or SDMA.DMA4_CDFli, the user must set the SDMA.DMA4_CCRi[24]

SEL_SRC_DST_SYNC respectively to 1 or 0.

NOTE: The packet size can be a sub-multiple or non sub-multiple of a frame size. If DMA Packet_Data_Size is aligned on DMA channel block data size boundary, DMA will transfer the last data in channel block boundary and stop at block boundary for the last packet DMA request. If the Packet_Data_size is not aligned on the block boundary, the remaining data smaller than a packet size are transferred using burst or single accesses to complete the block.

- DMA Packet_Data_Transfer does not affect DMA channel capabilities in term of packing and bursting. The Packet synchronization mode is active when SDMA.DMA4_CCRi[5] FS = SDMA.DMA4_CCRi[18] BS = 1. Then
 - if SDMA.DMA4_CCRi[24] SEL_SRC_DST_SYNC=0; SDMA.DMA4_CDFIi[15:0] gives the number of element in packet and SDMA.DMA4_CDFIi[31:16] is unused for the packet size.
 - if SDMA.DMA4_CCRi[24] SEL_SRC_DST_SYNC=1; SDMA.DMA4_CSFIi[15:0] gives the number of element in packet and SDMA.DMA4_CSFIi[31:16] is unused for the packet size.

NOTE: The maximum transfer size, regardless of the packet size, is always: Block_size = Number_of_Frame_in_Block x Number_of_Element_in_Frame x Element_Size. If the DMA channel packet/burst access is across packet boundary, DMA hardware automatically splits this packing/burst access into multiple smaller accesses, which will be aligned on packet boundary. Otherwise, the DMA transfers data as usual packing/burst access.

9.4.14 Graphics Acceleration Support

The SDMA supports two graphic acceleration features:

- Transparent copy
- Constant fill

Only one of these features can be enabled at any given time through the SDMA.DMA4_CCRi register for the particular logical DMA channel.

The transparent copy feature enables specification of a particular color through the SDMA.DMA4_COLORi register, so that when it is recognized in the data from the source, it is not copied to the corresponding location in the destination, but instead leaves the data in the corresponding location in the destination as it is.

Figure 9-12 shows the 2-D graphic transparent color block diagram.

Figure 9-12. 2-D Graphic Transparent Color Block Diagram

108-004

The constant fill feature provides the ability to specify a particular color through the SDMA.DMA4_COLORi register for every specified location in the destination. In this case, the transfer consists only of writing to the destination without reading from a source.

Both features support 8 bpp (bits per pixel), 16 bpp, and 24 bpp, depending on what is specified as the DMA transfer ES via the SDMA.DMA4_CSDPi register. An ES of 32 bits corresponds to 24 bpp. During a 32-bit (24 bpp) transfer, the most-significant 8 bits ([31:24]) are 0. Both features are compatible with packed and burst transactions.

9.4.15 Supervisor Modes

A logical DMA channel can be configured to operate in supervisor mode through the corresponding bits in the channel SDMA.DMA4_CCRi register. This must be done using supervisor access. Once a channel is configured in supervisor mode, the channel configuration is protected from nonsupervisor accesses. All DMA transactions on a supervisor channel are supervisor transactions.

9.4.16 Posted and Nonposted Writes

A logical channel can be configured in its DMA register bits SDMA.DMA4_CSDPi[17:16] to use one of three write access handshake modes for the destination:

- Nonposted write: Each write must complete before transfer can continue or complete.
- Posted write: Transfer continues without waiting for each write to complete (might improve performance with slow devices).
- Posted with final write nonposted: Transfer continues without waiting for each write to complete, but final write is completed before transfer can complete.

9.4.17 Disabling a Channel During Transfer

When a channel is disabled during a transfer, the channel will undergo an abort, except if the channel was hardware source synchronized with buffering Enabled (SDMA.DMA4_CCRi[25] BUFFERING_DISABLE='0'). In that case, the fifo will be drained in order to avoid losing data. See [Section 9.4.18](#) for details on this feature.

9.4.18 FIFO Draining Mechanism

When a source synchronized channel is disabled during a transfer, then the current hardware request (element/packet/frame/block) service is completed and the channel SDMA.DMA4_CCRi[9] RD_ACTIVE bit is set to 0, which means the channel is not active on the read port. The remaining data in the corresponding disabled channel FIFO is drained onto the write port and transferred to the programmed destination as in normal transfer.

At the end of the draining the SDMA.DMA4_CCRi[10] WR_ACTIVE bit is set to 0 (channel is no more active on the write port) and if the SDMA.DMA4_CICRI[12] DRAIN_END_IE is set to 1, the status bit DMA4_CSRi[12] DRAIN_END is updated and an interrupt is generated.

Once a channel is disabled during a transfer, it needs to wait for SDMA.DMA4_CCRi[9] RD_ACTIVE and SDMA.DMA4_CCRi[10] WR_ACTIVE to become '0' before being re-enabled for a new transfer. The FIFO drain for a channel will happen only in the following cases:

- If the channel is a source synchronized channel and SDMA.DMA4_CCRi[25] BUFFERING_DISABLE='0' and
- If the channel is not a solid fill channel and
- If the channel is not a transparent and copy channel

NOTE: In case of a self-linked or chain-linked channel, it is user responsibility to disable the SDMA.DMA4_CLNK_CTRLi[15] ENABLE_LINK bit before disabling the channel.

In all other cases, the channel will undergo an abort.

NOTE: If the channel intended to be used is a drain candidate, always enable DRAIN END INTERRUPT for that channel.

When the sDMA is in smart standby mode, before disabling a drain candidate channel (DMA4_CCRi[7] ENABLE = 0x0), the sDMA must be configured to be in force standby mode (DMA4_OCP_SYSCONFIG[13:12] = 0x0) or in no standby mode (DMA4_OCP_SYSCONFIG[13:12] = 0x1). After the occurrence of DRAIN END INTERRUPT EVENT from that channel, the sDMA can be switched back to smart standby mode (DMA4_OCP_SYSCONFIG[13:12] = 0x2).

9.4.19 Reset

Following a software or hardware reset, all fields in the logical channel registers have undefined values, except 5 bits in the SDMA.DMA4_CCRi and SDMA.DMA4_CICRi registers. Thus, when programming a channel for the first time, the remaining fields in all channel registers must be configured before enabling the channel.

NOTE: After a reset, the global registers take their specified reset values.

9.4.20 Power Management

The SDMA module provides two methods to reduce power consumption:

- Interconnect clock auto-idle
- Automatic standby mode

9.4.20.1 Interconnect Clock Auto-Idle

The interconnect clock auto-idle power-saving mode is enabled or disabled in DMA register bit SDMA.DMA4_OCP_SYSCONFIG[0]. When this mode is enabled and there is no activity on the interconnect interface, the interconnect clock is disabled internally to the module to reduce power consumption. When there is new activity on the interconnect interface, the interconnect clock is restarted without any latency penalty. After reset, this mode is disabled by default. Enabling this mode is recommended to reduce power consumption.

9.4.20.2 Automatic Standby Mode

As part of the system-wide power-management scheme, the module can go into a standby mode at the request of the power, reset, and clock management (PRCM) module (for more information, see [Chapter 4, Power, Reset, and Clock Management](#)).

The module can be configured to one of the following standby modes using the DMA register bits SDMA.DMA4_OCP_SYSCONFIG[13:12]:

- No standby mode: The module never goes into standby mode.
- Force standby mode: The module goes into standby mode only when all the DMA channels are disabled.
- Smart standby mode: The module enters standby mode when:
 - All DMA channels are disabled.
 - No nonsynchronized channel is enabled, no DMA request line is asserted, and no DMA request is pending in the module.

9.5 SDMA Basic Programming Model

9.5.1 Setup Configuration

After a software or hardware reset, program all fields in the logical channel registers to default values for any channels used, because most fields are undefined following reset.

Before programming any DMA transfers, the priority arbitration rate and the maximum FIFO depth must be configured through the `SDMA.DMA4_GCR` register, and any required interrupts must be enabled through the `SDMA.DMA4_IRQENABLE_Lj` registers and the logical channel `SDMA.DMA4_CICRi` registers.

Software clears the `SDMA.DMA4_CSRi` register and the `IRQSTATUS` bit for the different interrupt lines before enabling the channel.

9.5.2 Software-Triggered (Nonsynchronized) Transfer

To program a software-triggered DMA transfer:

1. Configure the transfer parameters in the logical DMA channel registers:

- `SDMA.DMA4_CSDPi`:
 - Transfer ES (8 bits, 16 bits, or 32 bits) and DMA register bits `SDMA.DMA4_CSDPi[1:0]`
 - Read and write port access types (single/burst), DMA register bits `SDMA.DMA4_CSDPi[8:7]` and `SDMA.DMA4_CSDPi[15:14]`
 - Source and destination endianness, DMA register bits `SDMA.DMA4_CSDPi[21]` and `SDMA.DMA4_CSDPi[19]`
 - Write mode (posted or nonposted) and DMA register bits `SDMA.DMA4_CSDPi[17:16]`
 - Source or destination packed or nonpacked (if the ES is less than the read/write port size), DMA register bits `SDMA.DMA4_CSDPi[6]` and `SDMA.DMA4_CSDPi[13]`
- `SDMA.DMA4_CENi`: EN
- `SDMA.DMA4_CFNi`: FN per transfer block
- `SDMA.DMA4_CSSAi` and `SDMA.DMA4_CDSAi`: Source and destination start address (aligned with transfer ES)
- `SDMA.DMA4_CCRi`:
 - Read and write port addressing modes, DMA register bits `SDMA.DMA4_CCRi[13:12]` and `SDMA.DMA4_CCRi[15:14]`
 - Priority bit for both read and write ports, DMA register bits `SDMA.DMA4_CCRi[6]` and `SDMA.DMA4_CCRi[26]`
 - DMA request number (set to 0 for a software-triggered transfer) and DMA register bits `SDMA.DMA4_CCRi[4:0] = 0` and `SDMA.DMA4_CCRi[20:19] = 0`
- `SDMA.DMA4_CSEi`, `SDMA.DMA4_CSFi`, `SDMA.DMA4_CDEi`, and `SDMA.DMA4_CDFi`: Source and destination element and frame indexes (depending on addressing mode)

2. Start the transfer through the enable bit in the channel `SDMA.DMA4_CCRi` register and DMA register bit `SDMA.DMA4_CCRi[7]`

The example below perform a DMA transfer on channel 10 of a 240*160 picture from RAM to RAM (0x80C00000 to 0x80F00000) :

```

UWORD32 RegVal = 0;
DMA4_t *DMA4;

DMA4 = (DMA4_t *)malloc(sizeof(DMA4_t));
/* Init. parameters */
DMA4->DataType = 0x2; // DMA4_CSDPi[1:0]
DMA4->ReadPortAccessType = 0; // DMA4_CSDPi[8:7]
DMA4->WritePortAccessType = 0; // DMA4_CSDPi[15:14]
DMA4->SourceEndiansim = 0; // DMA4_CSDPi[21]
DMA4->DestinationEndianness = 0; // DMA4_CSDPi[19]
DMA4->WriteMode = 0; // DMA4_CSDPi[17:16]
DMA4->SourcePacked = 0; // DMA4_CSDPi[6]
DMA4->DestinationPacked = 0; // DMA4_CSDPi[13]
DMA4->NumberOfElementPerFrame = 240; // DMA4_CENi
DMA4->NumberOfFramePerTransferBlock = 160; // DMA4_CFNi
DMA4->SourceStartAddress = 0x80C00000; // DMA4_CSSAi
DMA4->DestinationStartAddress = 0x80F00000; // DMA4_CDSAi
DMA4->SourceElementIndex = 1; // DMA4_CSEi
DMA4->SourceFrameIndex = 1; // DMA4_CSFi
DMA4->DestinationElementIndex = 1; // DMA4_CDEi
DMA4->DestinationFrameIndex = 1; // DMA4_CDFi
DMA4->ReadPortAccessMode = 1; // DMA4_CCRi[13:12]
DMA4->WritePortAccessMode = 1; // DMA4_CCRi[15:14]
DMA4->ReadPriority = 0; // DMA4_CCRi[6]

```

```

DMA4->WritePriority = 0; // DMA4_CCRi[23]
DMA4->ReadRequestNumber = 0; // DMA4_CCRi[4:0]
DMA4->WriteRequestNumber = 0; // DMA4_CCRi[20:19]

/* 1) Configure the transfer parameters in the logical DMA registers */
/*-----*/
/* a) Set the data type CSDP[1:0], the Read/Write Port access type CSDP[8:7]/[15:14], the
Source/dest endiansim CSDP[21]/CSDP[19], write mode
CSDP[17:16], source/dest packed or non-packed CSDP[6]/CSDP[13]*/
// Read CSDP
RegVal = DMA4_CSDP_CH10;

// Build reg
RegVal = ((RegVal & ~0x3) | DMA4->DataType );
RegVal = ((RegVal & ~(0x3 << 7)) | (DMA4->ReadPortAccessType << 7));
RegVal = ((RegVal & ~(0x3 << 14)) | (DMA4->WritePortAccessType << 14));
RegVal = ((RegVal & ~(0x1 << 21)) | (DMA4->SourceEndiansim << 21));
RegVal = ((RegVal & ~(0x1 << 19)) | (DMA4->DestinationEndianism << 19));
RegVal = ((RegVal & ~(0x3 << 16)) | (DMA4->WriteMode << 16));
RegVal = ((RegVal & ~(0x1 << 6)) | (DMA4->SourcePacked << 6));
RegVal = ((RegVal & ~(0x1 << 13)) | (DMA4->DestinationPacked << 13));

// Write CSDP
DMA4_CSDP_CH10 = RegVal;

RegVal = ((RegVal & ~(0x1 << 6)) | (DMA4->ReadPriority << 6));
RegVal = ((RegVal & ~(0x1 << 26)) | (DMA4->WritePriority << 26));
RegVal&= 0xFFCFFFE0 ;

// Write CCR
DMA4_CCR_CH10 = RegVal;

/* f)- Set the source element index CSEI[15:0]*/
DMA4_CSEI_CH10 = DMA4->SourceElementIndex;

/* - Set the source frame index CSFI[15:0]*/
DMA4_CSFI_CH10 = DMA4->SourceFrameIndex ;

/* - Set the destination element index CDEI[15:0]*/
DMA4_CDEI_CH10 = DMA4->DestinationElementIndex;

/* - Set the destination frame index CDFI[31:0]*/
DMA4_CDFI_CH10 = DMA4->DestinationFrameIndex;

/* 2) Start the DMA transfer by Setting the enable bit CCR[7]=1 */
/*-----*/
//write enable bit
DMA4_CCR_CH10 |= 1 << 7; /* start */

```

9.5.3 Hardware-Synchronized Transfer

To monitor a hardware synchronized DMA transfer, initialize the SDMA.DMA4_CDACi register before the software enable.

To configure an LCh to synchronize by element, packet, frame, or block, the frame synchronization SDMA.DMA4_CCRi[5] FS bit and the block synchronization SDMA.DMA4_CCRi[18] BS bit register must be programmed. For all the following synchronized transfers (element, packet, frame or block synchronized transfers) User must set first : SDMA.DMA4_CCRi[24] SEL_SRC_DST_SYNC to 1 when the source triggers on the DMA request and SDMA.DMA4_CCRi[24] SEL_SRC_DST_SYNC to 0 when the Destination triggers on the DMA request. Note: User must take care when setting the SDMA.DMA4_CCRi[23] PREFETCH bit it is in conjunction with SDMA.DMA4_CCRi[24] SEL_SRC_DST_SYNC bit .

- To configure an LCh to transfer one element per DMA request:
 1. Set the number of DMA request associated to the current LCH in the SDMA.DMA4_CCRi[20:19] SYNCHRO_CONTROL_UPPER and SDMA.DMA4_CCRi[4:0] SYNCHRO bit field.
 2. Set the data type, also referenced as element size (ES), in the SDMA.DMA4_CSDPi[1:0] DATA_TYPE bit field.
 3. Set the Read Port access type (single or burst access) in the SDMA.DMA4_CSDPi[8:7] SRC_BURST_EN bit field.
 4. Set the Write Port access type (single or burst access) in the SDMA.DMA4_CSDPi[15:14] DST_BURST_EN bit field.
 5. Set the Read Port addressing mode in the SDMA.DMA4_CCRi[13:12] SRC_AMODE bit field.
 6. Set the Write Port addressing mode in the SDMA.DMA4_CCRi[15:14] DST_AMODE bit field.
 7. Set the Read start address in the SDMA.DMA4_CSSAi[31:0] SRC_START_ADRS bit field.
 8. Set the Write start address in the SDMA.DMA4_CDSAi[31:0] DST_START_ADRS bit field.
 9. Set both FS and BS to 0 in SDMA.DMA4_CCRi[5] FS and SDMA.DMA4_CCRi[18] BS.
 10. Set to 1 the channel enable bit SDMA.DMA4_CCRi[7] EN bit.
- To configure an LCh to transfer one frame per DMA request:
 1. Set the number of DMA request associated to the current LCH in the SDMA.DMA4_CCRi[20:19] SYNCHRO_CONTROL_UPPER and SDMA.DMA4_CCRi[4:0] SYNCHRO bit field.
 2. Set the data type, also referenced as element size (ES), in the SDMA.DMA4_CSDPi[1:0] DATA_TYPE bit field.
 3. Set the number of element per frame in the SDMA.DMA4_CENi[23:0] CHANNEL_ELMNT_NBR bit field.
 4. Set the Read Port access type (single or burst access) in the SDMA.DMA4_CSDPi[8:7] SRC_BURST_EN bit field.
 5. Set the Write Port access type (single or burst access) in the SDMA.DMA4_CSDPi[15:14] DST_BURST_EN bit field.
 6. Set the Read Port addressing mode in the SDMA.DMA4_CCRi[13:12] SRC_AMODE bit field.
 7. Set the Write Port addressing mode in the SDMA.DMA4_CCRi[15:14] DST_AMODE bit field.
 8. Set the Read start address in the SDMA.DMA4_CSSAi[31:0] SRC_START_ADRS bit field.
 9. Set the Write start address in the SDMA.DMA4_CDSAi[31:0] DST_START_ADRS bit field.
 10. Set FS to 1 and BS to 0 respectively in SDMA.DMA4_CCRi[5] FS and SDMA.DMA4_CCRi[18] BS.
 11. Set to 1 the channel enable bit SDMA.DMA4_CCRi[7] EN bit.
- To configure an LCh to transfer one block per DMA request:
 1. Set the number of DMA request associated to the current LCH in the SDMA.DMA4_CCRi[20:19] SYNCHRO_CONTROL_UPPER and SDMA.DMA4_CCRi[4:0] SYNCHRO bit field.
 2. Set the data type, also referenced as element size (ES), in the SDMA.DMA4_CSDPi[1:0] DATA_TYPE bit field.
 3. Set the number of element per frame in the SDMA.DMA4_CENi[23:0] CHANNEL_ELMNT_NBR bit field.
 4. Set in the SDMA.DMA4_CFNi[15:0] CHANNEL_FRAME_NBR bit field the number of frame (transfers), to take place before the LCH is disabled.
 5. Set the Read Port access type (single or burst access) in the SDMA.DMA4_CSDPi[8:7] SRC_BURST_EN bit field.
 6. Set the Write Port access type (single or burst access) in the SDMA.DMA4_CSDPi[15:14]

DST_BURST_EN bit field.

7. Set the Read Port addressing mode in the SDMA.DMA4_CCRi[13:12] SRC_AMODE bit field.
8. Set the Write Port addressing mode in the SDMA.DMA4_CCRi[15:14] DST_AMODE bit field.
9. Set the Read start address in the SDMA.DMA4_CSSAi[31:0] SRC_START_ADRS bit field.
10. Set the Write start address in the SDMA.DMA4_CDSAi[31:0] DST_START_ADRS bit field.
11. Set FS to 0 and BS to 1 respectively in SDMA.DMA4_CCRi[5] FS and SDMA.DMA4_CCRi[18] BS.
12. Set to 1 the channel enable bit SDMA.DMA4_CCRi[7] EN bit.
 - To configure an LCh to transfer one packet per DMA request:
 1. Set the number of DMA request associated to the current LCH in the SDMA.DMA4_CCRi[20:19] SYNCHRO_CONTROL_UPPER and SDMA.DMA4_CCRi[4:0] SYNCHRO bit field.
 2. Set the data type, also referenced as element size (ES), in the SDMA.DMA4_CSDPi[1:0] DATA_TYPE bit field.
 3. Set the number of element per packet to transfer: If the packet requestor is in the source, set SDMA.DMA4_CCR.Sel_Src_Dst_Sync to 1 and set the packet element number in the SDMA.DMA4_CSFii register; else, if the packet requestor is in the destination, set the SDMA.DMA4_CCRi[24] SEL_SRC_DST_SYNC to 0 and set the packet element number in the SDMA.DMA4_CDFii register.
 4. Set the number of element per frame in the SDMA.DMA4_CENi[23:0] CHANNEL_ELMNT_NBR bit field.
 5. Set in the SDMA.DMA4_CFNi[15:0] CHANNEL_FRAME_NBR bit field the number of frame (transfers), to take place before the LCH is disabled.
 6. Set the element number in the packet in the SDMA.DMA4_CSFii[15:0] PKT_ELNT_NBR, if constant addressing or post-incremented addressing modes are used in the source side. However, the number of elements in the packet is set in the SDMA.DMA4_CDFii[15:0] PKT_ELNT_NBR if constant addressing mode is used in the destination side.
 7. Set the Read Port access type (single or burst access) in the SDMA.DMA4_CSDPi[8:7] SRC_BURST_EN bit field.
 8. Set the Write Port access type (single or burst access) in the SDMA.DMA4_CSDPi[15:14] DST_BURST_EN bit field.
 9. Set the Read Port addressing mode in the SDMA.DMA4_CCRi[13:12] SRC_AMODE bit field.
 10. Set the Write Port addressing mode in the SDMA.DMA4_CCRi[15:14] DST_AMODE bit field.
 11. Set the Read start address in the SDMA.DMA4_CSSAi[31:0] SRC_START_ADRS bit field.
 12. Set the Write start address in the SDMA.DMA4_CDSAi[31:0] DST_START_ADRS bit field.
 13. Set FS to 1 and BS to 1 respectively in SDMA.DMA4_CCRi[5] FS and SDMA.DMA4_CCRi[18] BS.
 14. Set to 1 the channel enable bit SDMA.DMA4_CCRi[7] EN bit.

NOTE: It is possible to stop a transfer by disabling the channel. This is done by resetting the ENABLE bit in the SDMA.DMA4_CCRi register.

9.5.4 Synchronized Transfer Monitoring Using CDAC

The SDMA.DMA4_CDACi register is writable and non-initialized (value undefined). It can be initialized to monitor a transfer by applying the following programming model:

1. Write 0 in the SDMA.DMA4_CDACi
2. Enable the channel.
3. If timeout occurs, read SDMA.DMA4_CDACi
4. If SDMA.DMA4_CDACi != SDMA.DMA4_CDACi reset value:
 - Then transfer starts. User can then rely on SDMA.DMA4_CCENi and SDMA.DMA4_CCFNi element and frame counters.
 - Else, if SDMA.DMA4_CDACi = SDMA.DMA4_CDACi reset value:
 - Then transfer does not start.

9.5.5 Concurrent Software and Hardware Synchronization

This section describes thread allocation only, not the entire transfer. Because synchronized transfers are latency critical, you must allocate a thread on the synchronized target side at least.

Even for multiple concurrent channels, thread reservation guarantees that as soon as an HW DMA request comes in, the read/write scheduler finds available thread(s) to initiate a channel schedule and issue a read/write transaction.

Consider these six concurrent channels:

- Channels 0/1/2/3 are dedicated to memory-memory transfer: they are software triggered and not synchronized.
 - Channel 4 is dedicated to memory→peripheral transfer, hardware triggered, and synchronized on the write side.
 - Channel 5 is dedicated to peripheral→memory transfer, hardware triggered, and synchronized on the read side.
1. Allow thread reservation for priority channel 4 and channel 5:
Reserve one thread (Read ThreadID 0) on the read port: Set SDMA.DMA4_GCR[13:12] = 0x1.
Reserve one thread (Write ThreadID 0) on the write port: Set SDMA.DMA4_GCR[13:12] = 0x1.
 2. Specify channel priority:
Channel 4 is a write high priority channel: Set SDMA.DMA4_CCRi[26] = 1.
Channel 5 is a read high priority channel: Set SDMA.DMA4_CCRi[6] = 1.

9.5.6 Chained Transfer

A chained DMA transfer can be programmed as follows:

1. Configure the transfer parameters for each logical DMA channel in the chain as in step 1 for either the synchronized or non-synchronized transfers above.
2. For each channel in the chain, configure the SDMA.DMA4_CLNK_CTRLi register as follows:
 - Next logical DMA channel number (for a looping chained transfer link last channel to first channel number), in DMA register bits SDMA.DMA4_CLNK_CTRLi[4:0].
 - Include the logical channel to the chain and enable link by setting the DMA register bit SDMA.DMA4_CLNK_CTRLi[15].
 - For a non-looping chain, the last logical channel in the chain must have the DMA register bit SDMA.DMA4_CLNK_CTRLi[15] set to 0 to indicate the end of the chain.
3. Enable the transfer via the enable bit in the first logical channel DMA register bit SDMA.DMA4_CCRi[7]. All other channels in the chain must be configured as disabled. Each channel is enabled automatically in turn when the previous logical channel transfer completes. A non-synchronized transfer starts immediately; a hardware-synchronized transfer starts when the DMA request line corresponding to the first DMA channel in the chain is asserted.

To stop a looping chained transfer, disable the NEXTLCH_ID bit, DMA register bit SDMA.DMA4_CLNK_CTRLi[15](ENABLE_LNK bit set to 0x0), of the final channel transfer.

In the RAM to RAM copy example, to copy in loop it's possible to link channel 10 on itself. The following line can be added in the channel configuration :

```
/* g) Set link for loop */
DMA4_CLNK_CTRL_CH10 = 0x0000800A;
```

9.5.7 90° Clockwise Image Rotation

The 90° clockwise image rotation example described in [Section 9.4.3, Addressing Modes](#), can be programmed as follows:

1. Configure the transfer parameters in the logical DMA channel registers:
 - SDMA.DMA4_CSDPi:
 - Transfer ES = 32-bit (32 bpp), DMA register bits SDMA.DMA4_CSDPi[1:0]
 - Read and write port access types = maximum burst size supported by memory device, DMA register bits SDMA.DMA4_CSDPi[8:7] and SDMA.DMA4_CSDPi[15:14]

- Source and destination endianness, DMA register bits SDMA.DMA4_CSDPi[21] and SDMA.DMA4_CSDPi[19]
 - Write mode = posted with last element nonposted, DMA register bits SDMA.DMA4_CSDPi[17:16]
 - Source and destination packed = Yes (although destination writes will not benefit because EI>1), DMA register bits SDMA.DMA4_CSDPi[6] and SDMA.DMA4_CSDPi[13]
 - SDMA.DMA4_CENi: EN = 240
 - SDMA.DMA4_CFNi: FN per transfer block = 160
 - SDMA.DMA4_CSSAi: Source start address = 0x100000
 - SDMA.DMA4_CDSAi: destination start address = 0x20013E
 - SDMA.DMA4_CCRi:
 - Read and write port addressing modes = double-index addressing mode for both or post-increment addressing on source and double-index addressing on destination, DMA register bits SDMA.DMA4_CCRi[13:12] and SDMA.DMA4_CCRi[15:14]
 - Low or high priority, DMA register bit SDMA.DMA4_CCRi[6]
 - DMA request number = 0 (for software-triggered transfer), DMA register bits SDMA.DMA4_CCRi[4:0] and SDMA.DMA4_CCRi[20:19]
 - SDMA.DMA4_CSEi: Source EI = 1
 - SDMA.DMA4_CSFi: Source frame index = 1
 - SDMA.DMA4_CDEi: destination EI = 637
 - SDMA.DMA4_CDFi: destination frame index = -152967
2. Start the transfer via the enable bit in the channel SDMA.DMA4_CCRi register.

Below are the parameters to perform this rotation from 0x80C00000 RAM address to 0x80F00000, with the same code as in [Section 9.5.2](#):

```

/* Init. parameters */
DMA4->DataType = 0x2; // DMA4_CSDPi[1:0]
DMA4->ReadPortAccessType = 0x3; // DMA4_CSDPi[8:7]
DMA4->WritePortAccessType = 0x3; // DMA4_CSDPi[15:14]
DMA4->SourceEndiansim = 0; // DMA4_CSDPi[21]
DMA4->DestinationEndianness = 0; // DMA4_CSDPi[19]
DMA4->WriteMode = 0x2; // DMA4_CSDPi[17:16]
DMA4->SourcePacked = 0x1; // DMA4_CSDPi[6]
DMA4->DestinationPacked = 0x1; // DMA4_CSDPi[13]
DMA4->NumberOfElementPerFrame = 240; // DMA4_CENi
DMA4->NumberOfFramePerTransferBlock = 160; // DMA4_CFNi
DMA4->SourceStartAddress = 0x80C00000; // DMA4_CSSAi
DMA4->DestinationStartAddress = 0x80F00000; // DMA4_CDSAi
DMA4->SourceElementIndex = 1; // DMA4_CSEi
DMA4->SourceFrameIndex = 1; // DMA4_CSFi
DMA4->DestinationElementIndex = 637; // DMA4_CDEi
DMA4->DestinationFrameIndex = -152967; // DMA4_CDFi
DMA4->ReadPortAccessMode = 0x3; // DMA4_CCRi[13:12]
DMA4->WritePortAccessMode = 0x3; // DMA4_CCRi[15:14]
DMA4->ReadPriority = 0; // DMA4_CCRi[6]
DMA4->WritePriority = 0; // DMA4_CCRi[23]
DMA4->ReadRequestNumber = 0; // DMA4_CCRi[4:0]
DMA4->WriteRequestNumber = 0; // DMA4_CCRi[20:19]

```

9.5.8 Graphic Operations

- Transparent copy:
 - 1. Set the SDMA.DMA4_CCRi[17] Transparent_Copy_Enable bit field to 1.
 - 2. Set the SDMA.DMA4_CCRi[16] Constant_Fill_Enable bit field to 0.
 - 3. Set the value of key the color in the SDMA.DMA4_COLORi[15:0] color_key bit field.

To perform this graphic operation, the following lines can be added to the example of [Section 9.5.2](#)

```

DMA4_CCR_CH10 &= ~(0x1 << 16);
DMA4_CCR_CH10 |= 0x1 << 17;
DMA4_COLOR_CH10 = 0x00000003;

```

- Solid Color fill:

- 1. Set the SDMA.DMA4_CCRi[16] Constant_Fill_Enable bit field to 1.
 - 2. Set the SDMA.DMA4_CCRi[17] Transparent_Copy_Enable bit field to 0.
 - 3. Set the value of key the color in the DMA4_COLORi[15:0] solid_color bit field.
- To perform this graphic operation, the following lines can be added to the example of [Section 9.5.2](#)

```
DMA4_CCR_CH10 &= ~(0x1 << 17);
DMA4_CCR_CH10 |= 0x1 << 16;
DMA4_COLOR_CH10 = 0x00000003;
```

9.6 SDMA Use Cases and Tips

9.6.1 Camcorder Use Case: How to Configure SDMA to Handle Transfers With McBSP2 and MMC to External DRAM

9.6.1.1 Introduction

In this use case, the SDMA manages:

- The audio stream between the McBSP and the external DRAM
- The audio stream between the external DRAM and the MMC buffer
- The video stream between the external DRAM and the MMC buffer

The following sections describe how to configure the SDMA controller with MMC and McBSP in this use case.

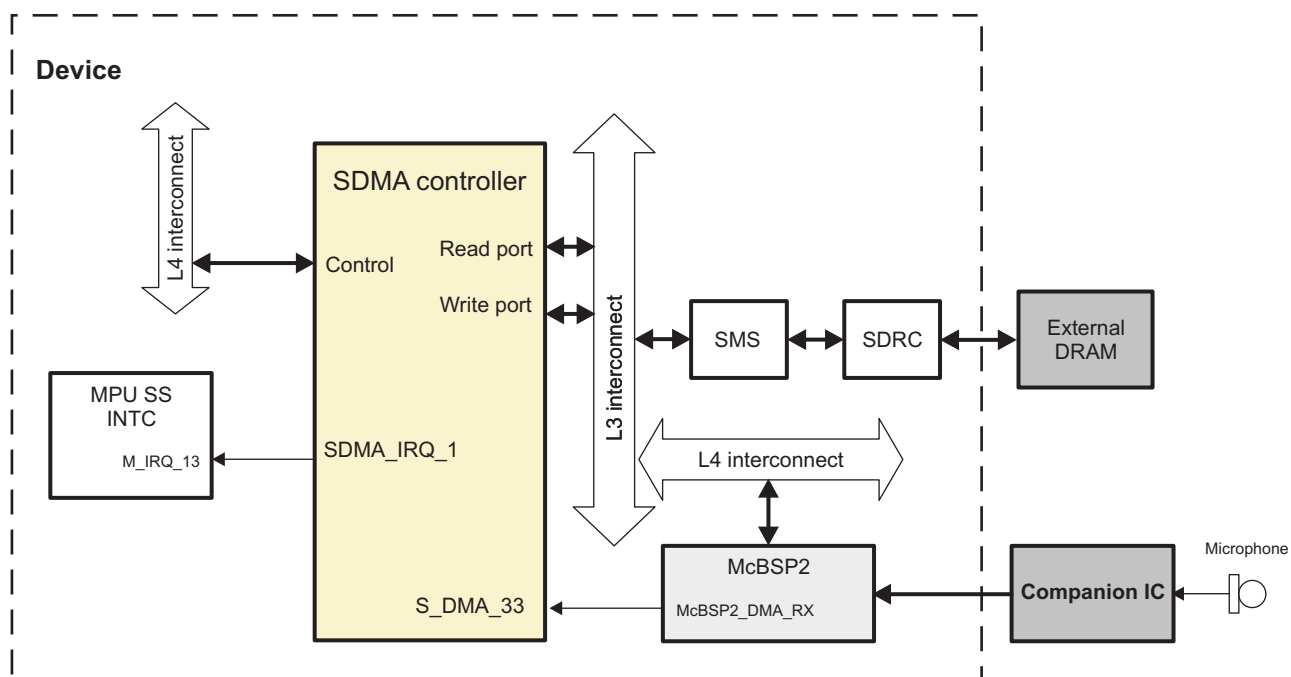

9.6.1.2 SDMA Configuration to Transfer Data Between the McBSP and External DRAM

9.6.1.2.1 Overview

The SDMA gets data from the McBSP_DRR register and copies it into three rolling buffers in the external DRAM.

Figure 9-13 is an overview of the audio path.

Figure 9-13. Overview

dma_F98-001

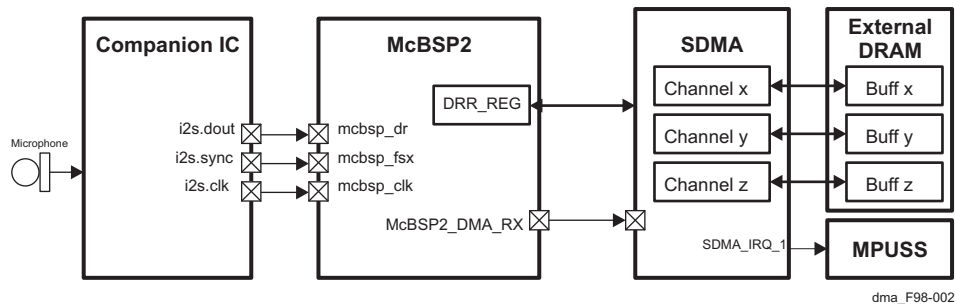

For the camcorder use case, the DMA transfer data format is:

- Frame size = 2048 x 32 bits
- Three DMA channels to manage three transfers to three memory buffers
- Interrupt generated at the end of each frame transfer
- Transfer triggered by McBSP2

9.6.1.2.2 Environment

The DMA accesses MCBSP2_DRR_REG through the interconnect and receives a DMA request from this McBSP module for driving transfers. The DMA accesses the external DRAM through the interconnect. The McBSP is directly connected to the companion IC device. [Figure 9-14](#) shows the environment of this scenario.

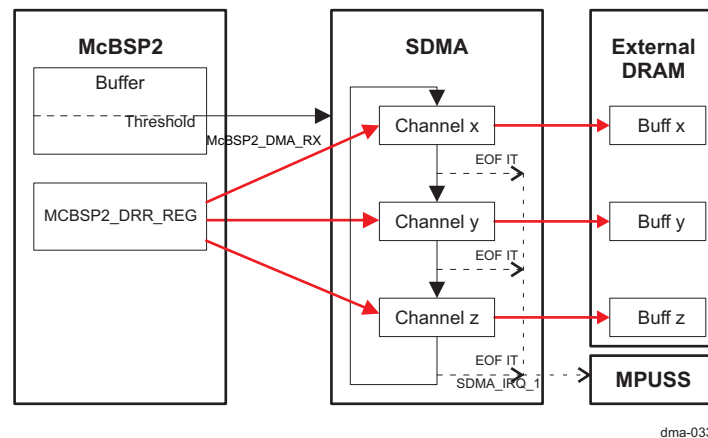

Figure 9-14. Environment

9.6.1.2.3 Data Path

The transfer is started when the DMA transfer is enabled and the **MCBSP2_DMA_REQ** is asserted (that is, when the McBSP FIFO threshold is reached). The DMA starts copying the first frame into the first memory buffer. When a whole frame has been transferred (2048 data), an interrupt is asserted to the MPU, and then the second channel is enabled and fills the second buffer, and so on. [Figure 9-15](#) shows the data flow.

Figure 9-15. Data Flow

9.6.1.2.4 Programming Flow

To establish a configuration for the DMA transfers, the following points have been considered.

The **McBSP2_DRR_REG** register is 32 bits wide, but in the camcorder use case, only the 16 LSBs are used (monophonic 16-bit-wide audio channel).

The McBSP receives data in a FIFO buffer. As long as the occupied locations level in this read buffer is greater than or equal to the threshold value + 1, the DMA request is asserted. After transferring the configured (THRSH1_REG value + 1) number of words, the receive DMA request is deasserted and then reasserted when the conditions are met again. Therefore, the DMA can receive at least threshold value data, with a threshold maximum value = 1280 elements = size of McBSP2 FIFO.

The frame synchronization transfer mode of the SDMA can be used with McBSP for frames with a size equal to the threshold. In the use case, however, the audio data frame is equal to 2048 elements, which is greater than the maximum transfer length possible with the McBSP.

Because the SDMA cannot be configured in frame synchronization mode, packet synchronization mode must be used. This mode enables to specify the maximum size of a transfer and to divide a frame into as many packet as needed. It is then possible to configure a frame of n elements and generate an interrupt at the end-of-frame transfer, while the transfer is segmented into packets.

The management of the three memory buffers is done by configuring three DMA channels linked between themselves: channel x is linked to channel y, channel y is linked to channel z, and channel z is linked to channel x. The three channels have the same configuration, except for the destination address, which corresponds to the three buffer addresses. Channels 11, 12, and 13 are used. Each channel generates the end-of-frame interrupts on the L1 interrupt line of the SDMA, to warn the MPU of the end of a frame transfer.

With these considerations, the DMA register of the three channels (i = 11, 12, and 13) is configured as follows:

1. Channel source destination parameters: [DMA4_CSDPi](#)

- [DMA4_CSDPi](#)[1:0] DATA_TYPE = 0x1: Read 16-bit elements from the McBSP_DRR_REG register.
- [DMA4_CSDPi](#)[5:2] RD_ADD_TRSLT = 0: Not useful
- [DMA4_CSDPi](#)[6] SRC_PACKED = 0x0: Cannot pack source data
- [DMA4_CSDPi](#)[8:7] SRC_BURST_EN = 0x0: Cannot burst source
- [DMA4_CSDPi](#)[12:9] WR_ADD_TRSLT = 0: Undefined
- [DMA4_CSDPi](#)[13] DST_PACKED = 0x1: Pack two 16-bit elements in one 32-bit packet to optimize transfer.
- [DMA4_CSDPi](#)[15:14] DST_BURST_EN = 0x3: Burst at 16x32-bit
- [DMA4_CSDPi](#)[17:16] WRITE_MODE = 0x1: Write posted
- [DMA4_CSDPi](#)[18] DST_ENDIAN_LOCK = 0x0: Endianness adapt
- [DMA4_CSDPi](#)[19] DST_ENDIAN = 0x0: Little endian type at destination
- [DMA4_CSDPi](#)[20] SRC_ENDIAN_LOCK = 0x0: Endianness adapt
- [DMA4_CSDPi](#)[21] SRC_ENDIAN = 0x0: Little endian type at source
- [DMA4_CSDPi](#)[31:22] RESERVED = 0x0: For future compatibility

2. Channel control register: [DMA4_CCRi](#)

- [DMA4_CCRi](#)[4:0] SYNCHRO_CONTROL = DmaReq & 0x1F = 0x2: 5 first bits of McBSP2_DMA_RX
- [DMA4_CCRi](#)[5] FS = 1: Packet mode with BS = 0x1
- [DMA4_CCRi](#)[6] READ_PRIORITY = 0x0: Low priority on read side
- [DMA4_CCRi](#)[7] ENABLE = 0x0: The logical channel is disabled.
- [DMA4_CCRi](#)[8] SUSPEND_SENSITIVE = 0
- [DMA4_CCRi](#)[9] RD_ACTIVE: Read status, read-only access
- [DMA4_CCRi](#)[10] WR_ACTIVE: Write status, read-only access
- [DMA4_CCRi](#)[11] RESERVED = 0: Write 0s for future compatibility.
- [DMA4_CCRi](#)[13:12] SRC_AMODE = 0x0: Constant address mode; DMA always reads McBSP2_DRR_REG.
- [DMA4_CCRi](#)[15:14] DST_AMODE = 0x1: Post-incremented address mode
- [DMA4_CCRi](#)[16] CONST_FILL_ENABLE = 0x0: Constant fill mode is disabled.
- [DMA4_CCRi](#)[17] TRANSPARENT_COPY_ENABLE = 0x0: Transparent copy mode is disabled.
- [DMA4_CCRi](#)[18] BS = 0x1: Packet mode with FS = 0x1
- [DMA4_CCRi](#)[20:19] SYNCHRO_CONTROL_UPPER = 0x1: Two MSBs of McBSP2_DMA_RX
- [DMA4_CCRi](#)[22] SUPERVISOR = 0x0: Supervisor mode is disabled.
- [DMA4_CCRi](#)[23] PREFETCH = 0x0: Prefetch mode is disabled, cannot prefetch a constant addressing source.
- [DMA4_CCRi](#)[24] SEL_SRC_DST_SYNC = 0x1: Transfer is triggered by the source. The packet

- element number is specified in the DMA4_CSFI register.
 - [DMA4_CCRi\[25\]](#) BUFFERING_DISABLE = 0x0
 - [DMA4_CCRi\[26\]](#) WRITE_PRIORITY = 0x0: Channel has low priority on Write side during the arbitration process.
 - [DMA4_CCRi\[31:27\]](#) RESERVED = 0x0: Write 0s for future compatibility.
3. Channel parameters: [DMA4_CENi](#), [DMA4_CFNi](#), [DMA4_CSSAi](#), [DMA4_CDSAi](#), [DMA4_CSEi](#), [DMA4_CSFi](#), [DMA4_CDEi](#)
 - [DMA4_CENi\[23:0\]](#) CHANNEL_ELMNT_NBR = 2048: 2048 elements
 - [DMA4_CFNi\[15:0\]](#) CHANNEL_FRAME_NBR = 1: One frame
 - [DMA4_CSSAi\[31:0\]](#) SRC_START_ADRS = 0x49022000: Channel source start address = MCBSP2_DRR_REG
 - [DMA4_CDSAi\[31:0\]](#) DST_START_ADRS= X, Y or Z: Channel destination start address in external DRAM, where X, Y, and Z represent the addresses of the three buffers
 - [DMA4_CSEi\[31:0\]](#) CHANNEL_SRC_ELMNT_INDEX = 1: Channel source element index
 - [DMA4_CSFi\[15:0\]](#) 16BIT_PKT_ELNT_NBR = 0x80: 16-bit Packet size = MCBSP_FIFO_THRESHOLD + 1
 - [DMA4_CDEi\[15:0\]](#) CHANNEL_DST_ELMNT_INDEX = 0x1: Channel destination element index
 4. Channel linking: [DMA4_CLNK_CTRLi](#)
 - [DMA4_CLNK_CTRL11\[31:0\]](#) = 0x0000800C: Channel 11 is linked to channel 12.
 - [DMA4_CLNK_CTRL12\[31:0\]](#) = 0x0000800D: Channel 12 is linked to channel 13.
 - [DMA4_CLNK_CTRL13\[31:0\]](#) = 0x0000800B: Channel 13 is linked to channel 11.
 5. Interrupt management: [DMA4_CICRi](#) and [DMA4_IRQENABLE_Lj](#)
 - [DMA4_CICRi\[31:0\]](#) = 0x00000008: Enables the end of frame interrupt and disables others (the value of these registers is unknown after a reset; it is necessary to clear other bits)
 - [DMA4_IRQENABLE_L1\[31:0\]](#) = 0x00022800; interrupts of channels 11, 12, and 13 are unmasked on IRQ line L1.
 6. Launch transfer: [DMA4_CCRi\[7\]](#) ENABLE = 0x1: Enables the three channels, starting with channel 13, then 12, and finally 11; the last one triggers the others.

[Table 9-9](#) lists the registers of DMA channel 11 after a first transfer.

Table 9-9. Registers Print

Register Name	Address	Value	Value Description
DMA4_IRQENABLE_L1	0x4805601c	0x00022800	Interrupts of channels 11, 12, and 13 are unmasked on IRQ line L1.
DMA4_CICR11	0x480564a8	0x00000008	End-of-frame interrupt enabled
DMA4_CCR11	0x480564a0	0x010c40a2	Channel control register
DMA4_CSDP11	0x480564b0	0x0001e001	Channel source destination parameters
DMA4_CEN11	0x480564b4	0x00000800	Channel element number
DMA4_CFN11	0x480564b8	0x00000001	Channel frame number
DMA4_CSSA11	0x480564bc	0x49022000	Channel source start address
DMA4_CDSA11	0x480564c0	0x81e00000	Channel destination start address
DMA4_CSF11	0x480564c8	0x00000080	Packet size
DMA4_CSAC11	0x480564d4	0x49022000	Source address counter (read only)
DMA4_CDAC11	0x480564d8	0x81e01000	Destination address counter (read only)
DMA4_CCEN11	0x480564dc	0x00000800	Channel current transferred element number in the current frame (read only)
DMA4_CCFN11	0x480564e0	0x00000001	Channel current transferred frame number in the current transfer (read only)

Table 9-9. Registers Print (continued)

Register Name	Address	Value	Value Description
DMA4_CLNK_CTRL11	0x480564a4	0x0000800C	Channel link control register: Link to channel 12

Channels 12 and 13 have a similar configuration; only the destination address and channel link change.

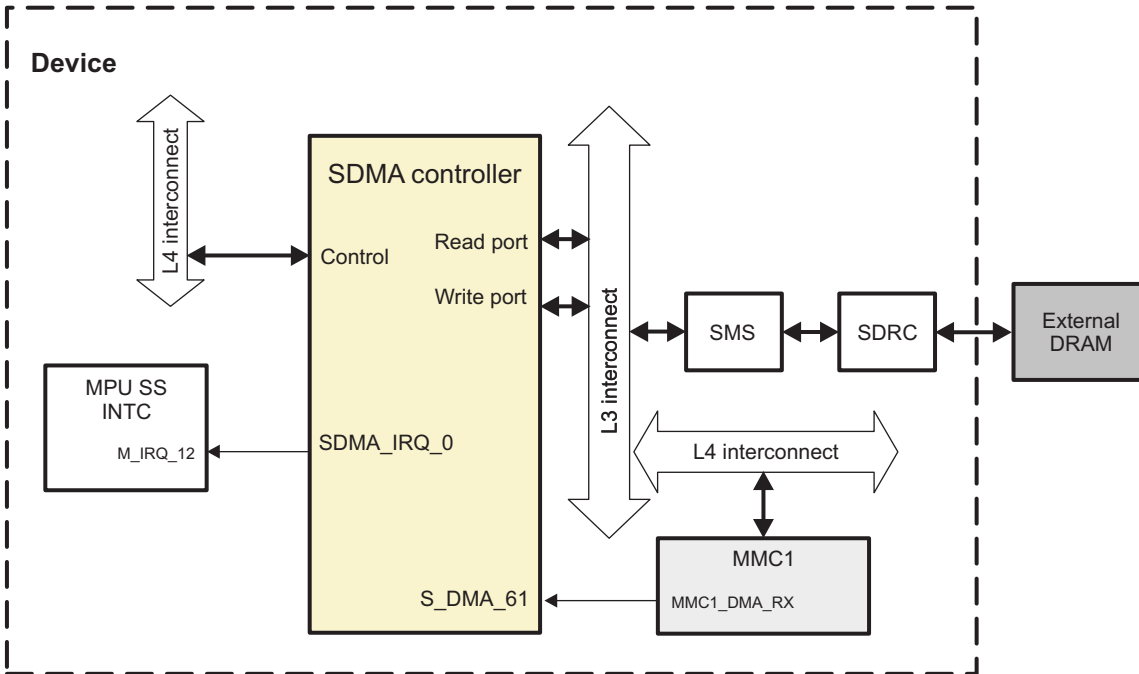

9.6.1.3 SDMA Configuration to Transfer Data Between MMC and External DRAM

9.6.1.3.1 Overview

The SDMA gets data from the MMC.MMCHS_DATA register and copies it into the external DRAM. The SDMA accesses the MMCHS_DATA through the interconnect and receives a DMA request from the MMC module for driving transfers. The DMA accesses the external DRAM through the interconnect. The transfer is started when the DMA transfer is enabled and the MMC1_DMA_REQ is asserted (that is, when the MMC buffer is ready).

Figure 9-16 is an overview of the path.

Figure 9-16. Overview

108-031

For the camcorder use case, the DMA transfer data format is:

- Frame size = 4096 x 32 bits
- packet size = 512 x 32 bits (512 elements ready in MMC when a DMA request is asserted)
- DMA channel to manage the transfer
- Interrupt generated at the end of each frame transfer
- Transfer triggered by MMC

9.6.1.3.2 Programming Flow

To establish a configuration for the DMA transfers, the following points have been considered.

The MMCHS_DATA register is 32 bits wide.

The SDMA is configured in packet synchronization mode. This mode enables to specify the transfer of any size frame and then to divide the frame into as many packet as needed. It is therefore possible to configure a frame of n elements and generate an interrupt at the end-of-frame transfer, while the transfer is segmented into packets.

The MMC puts its received data into a 1K-byte ping-pong buffer. When 512 x 32 bits are ready in this buffer, the DMA request is asserted. Then the DMA controller transfers the defined amount of elements divided into packets of 512 x 32-bit element (PKT_ELNT_NBR) transfers.

In the use case, the size of the transfer is set at 4096 x 32 bits, chosen after performance benches.

With these considerations, the DMA register of channel i is configured as follows:

1. Channel source destination parameters: [DMA4_CSDPi](#)

- [DMA4_CSDPi](#)[1:0] DATA_TYPE = 0x2: Read 32-bit elements from the MMCHS_DATA register.
- [DMA4_CSDPi](#)[5:2] RESERVED: Write 0s for future compatibility. Read returns 0.
- [DMA4_CSDPi](#)[6] SRC_PACKED = 0x0: Cannot pack source data
- [DMA4_CSDPi](#)[8:7] SRC_BURST_EN = 0x0: Cannot burst source
- [DMA4_CSDPi](#)[12:9] RESERVED: Write 0s for future compatibility. Read returns 0.
- [DMA4_CSDPi](#)[13] DST_PACKED = 0x0: No packing
- [DMA4_CSDPi](#)[15:14] DST_BURST_EN = 0x3: Burst at 16x32 bits
- [DMA4_CSDPi](#)[17:16] WRITE_MODE = 0x1: Write posted
- [DMA4_CSDPi](#)[18] DST_ENDIAN_LOCK = 0x0: Endianness adapt
- [DMA4_CSDPi](#)[19] DST_ENDIAN = 0x0: Little Endian type at destination
- [DMA4_CSDPi](#)[20] SRC_ENDIAN_LOCK = 0x0: Endianness adapt
- [DMA4_CSDPi](#)[21] SRC_ENDIAN = 0x0: Little endian type at source
- [DMA4_CSDPi](#)[31:22] RESERVED = 0x0: For future compatibility

2. Channel control register: [DMA4_CCRi](#)

- [DMA4_CCRi](#)[4:0] SYNCHRO_CONTROL = DmaReq & 0x1F = 0x1E: 5 first bits of MMC1_DMA_RX(62)
- [DMA4_CCRi](#)[5] FS = 1: Packet mode with BS = 0x1
- [DMA4_CCRi](#)[6] READ_PRIORITY = 0x0: Low priority on read side
- [DMA4_CCRi](#)[7] ENABLE = 0x0: The logical channel is disabled.
- [DMA4_CCRi](#)[8] SUSPEND_SENSITIVE = 0
- [DMA4_CCRi](#)[9] RD_ACTIVE: Read status, read-only access
- [DMA4_CCRi](#)[10] WR_ACTIVE: Write status, read-only access
- [DMA4_CCRi](#)[11] RESERVED = 0: Write 0s for future compatibility.
- [DMA4_CCRi](#)[13:12] SRC_AMODE = 0x0: Constant address mode; DMA always reads the MMCHS_DATA.
- [DMA4_CCRi](#)[15:14] DST_AMODE = 0x1: Post-incremented address mode
- [DMA4_CCRi](#)[16] CONST_FILL_ENABLE = 0x0: Constant fill mode is disabled.
- [DMA4_CCRi](#)[17] TRANSPARENT_COPY_ENABLE = 0x0: Transparent copy mode is disabled.
- [DMA4_CCRi](#)[18] BS = 0x1: Packet mode with FS = 0x1
- [DMA4_CCRi](#)[20:19] SYNCHRO_CONTROL_UPPER = 0x1: Two MSB of MMC1_DMA_RX(62)
- [DMA4_CCRi](#)[22] SUPERVISOR = 0x0: Supervisor mode is disabled.
- [DMA4_CCRi](#)[23] PREFETCH = 0x0: Prefetch mode is disabled; cannot prefetch a constant addressing source.
- [DMA4_CCRi](#)[24] SEL_SRC_DST_SYNC = 0x1: Transfer is triggered by the source. The packet element number is specified in the DMA4_CSF i register.
- [DMA4_CCRi](#)[25] BUFFERING_DISABLE = 0x0
- [DMA4_CCRi](#)[26] WRITE_PRIORITY = 0x0: Channel has low priority on write side during the arbitration process.
- [DMA4_CCRi](#)[31:27] RESERVED = 0x0: Write 0s for future compatibility.

3. Channel parameters: [DMA4_CENi](#), [DMA4_CFNi](#), [DMA4_CSSAi](#), [DMA4_CDSAi](#), [DMA4_CSEi](#), [DMA4_CSF \$i\$](#) , [DMA4_CDEi](#)

DMA4_CDAC2	0x48056178	0x8071acfc	Destination address counter (read only)
DMA4_CCEN2	0x4805617c	0x00000080	Channel current transferred element number in the current frame (read only)
DMA4_CCFN12	0x48056180	0x00000000	Channel current transferred frame number in the current transfer (read only)
DMA4_CLNK_CTRL2	0x48056144	0x00000000	Channel link control register: No link

9.7 SDMA Registers Manual

This section provides a global view of the memory mapping as seen from the MPU for SDMA. [Table 9-11](#) show the DMA register base address.

9.7.1 SDMA Instance Summary

Table 9-11. SDMA Instances Summary

Module Name	Base Address	Size
SDMA	0x4805 6000	4K bytes

9.7.2 SDMA Register Summary

[Table 9-12](#) lists all DMA4 controller registers and their physical addresses. [Table 9-13](#) through [Table 9-67](#) describe the individual register bits.

Index i represents the logical channel number ($i = 0$ to 31). The offset address for some registers is calculated from channel c number. For example, register SDMA.DMA4_CCR10 (channel 10) has an offset address of $10 * 0x60 = 0x3C0$, and so a physical address of $0x4800 A080 + 0x3C0 = 0x4800 A440$.

Index j represents the interrupt line number ($j = 0$ to 3) The offset address for some registers is calculated from channel c number. For example, register SDMA.DMA4_IRQSTATUS_L3 (line 3) has an offset address of $3 * 0x4 = 0xC$, and so a physical address of $0x4800 A008 + 0xC = 0x4800 A014$.

Table 9-12. SDMA Register Summary

Register Name	Type	Register Width (Bits)	Address Offset	SDMA Physical Address
DMA4_REVISION	R	32	0x0000 0000	0x4805 6000

9.7.3 SDMA Register Description

This section describes the registers used in the DMA4 controller.

NOTE: Some registers have no reset value (marked with -) because of hardware implementation in memory. Software must ensure the correct programming of these registers, if needed.

The shadow registers are used to read run time registers such as CCEN, CCFN, CDAC, or CSAC. Typically, when accessed in 8-bit or 16-bit access for two consecutive accesses, the value of the previous registers may change. This shadow register is used to hold the whole value to allow the next access to recover the remaining 24 bits or 16 bits.

The CSAC, CDAC, CCEN, and CCFN registers must be written or read in a way that enables the LSByte; otherwise, the shadow registers do not update the register.

There is no issue for 32-bit read-write transactions. For 16-bit transactions, read or write the LSByte first to enable the register update.

Table 9-13 through Table 9-67 describe the DMA register bits.

Table 9-13. DMA4_REVISION

Address Offset	0x0000 0000		Instance	SDMA
Physical Address	0x4805 6000			
Description	This register contains the DMA revision code			
Type	R

11	MISALIGNED_ADRS_ERR_INTERRUPT_CPBLTY	Misaligned error detection capability.	R	1
10	SUPERVISOR_ERR_INTERRUPT_CPBLTY	Supervisor error detection capability.	R	1
9	RESERVED	Reserved for non-GP devices.	R	1
8	TRANS_ERR_INTERRUPT_CPBLTY	Transaction error detection capability.	R	1
7	PKT_INTERRUPT_CPBLTY	End of Packet detection capability. 0x0: Does not support end of packet interrupt generation capability 0x1: Supports end of packet interrupt generation capability	R	0x1
6	SYNC_STATUS_CPBLTY	Sync_status_capability 0x0: Does not support synchronized transfer status bit generation 0x1: Supports synchronized transfer status bit generation	R	0x1
5	BLOCK_INTERRUPT_CPBLTY	End of block detection capability. 0x0: Does not support end of block interrupt generation capability 0x1: Supports end of block interrupt generation capability	R	0x1
4	LAST_FRAME_INTERRUPT_CPBLTY	Start of last frame detection capability. 0x0: Does not support last frame interrupt generation capability 0x1: Supports last frame interrupt generation capability	R	0x1

Bits	Field Name	Description	Type	Reset
3	FRAME_INTERRUPT_CPBLTY	End of frame detection capability. 0x0: Does not support end of frame interrupt generation capability 0x1: Supports end of frame interrupt generation capability	R	0x1
2	HALF_FRAME_INTERRUPT_CPBLTY	Detection capability of the half of frame end. 0x0: Does not support half of frame interrupt generation capability 0x1: Supports half of frame interrupt generation capability	R	0x1
1	EVENT_DROP_INTERRUPT_CPBLTY	Request collision detection capability. 0x0: Does not support event drop interrupt generation capability 0x1: Supports event drop interrupt generation capability	R	0x1
0	RESERVED	Reserved. Write 0s for future compatibility. Read returns 0.	RW	0x0

- [SDMA Register Summary: \[0\]](#)

Table 9-31. DMA4_GCR

Address Offset	0x0000 0078
Physical Address	0x4805 6078
Description	FIFO sharing between high and low priority channel. The Maximum per channel FIFO depth is bounded by the low and high channel FIFO budget. The high respectively low priority channels maximum burst size must be less than the min (high respectively low priority channel FIFO budget , per channel maximum FIFO depth)
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								ARBITRATION_RATE								HI_LO_FIFO_BUDGET		HI_THREAD_RESERVED		RESERVED				MAX_CHANNEL_FIFO_DEPTH							

Bits	Field Name	Description	Type	Reset
31:24	RESERVED	Reserved. Write 0s for future compatibility. Read returns 0.	RW	0x00
23:16	ARBITRATION_RATE	Arbitration switching rate between prioritized and regular channel queues	RW	0x01

Bits	Field Name	Description	Type	Reset
15:14	HI_LO_FIFO_BUDGET	<p>Allow to have a separate Global FIFO budget for high and low priority channels.</p> <p>For Hi priority Channel: (Per_channel_Maximum FIFO depth + 1) x Number of active High priority Channel =< High Budget FIFO</p> <p>For Low priority channel: (Per_channel_Maximum FIFO depth + 1) x Number of active Low priority Channel =< Low Budget FIFO</p> <p>0x0: no fixed budget for neither higher nor lower priority channel</p> <p>0x1: 75% of FIFO for low priority and 25% for high priority channels</p> <p>0x2: 25% of FIFO for low priority and 75% for high priority channels</p> <p>0x3: 50% of FIFO for low priority and 50% for high priority channels</p>	RW	0x0
13:12	HI_THREAD_RESERVED	<p>Allow thread reservation for high priority channel on both read and write ports.</p> <p>0x0: No ThreadID is reserved on the Read Port for high priority channels. No ThreadID is reserved on the Write Port for high priority channels.</p> <p>0x1: Read Port ThreadID 0 is reserved for high priority channels. Write Port ThreadID 0 is reserved for high priority channels.</p> <p>0x2: Read port ThreadID 0 and ThreadID 1 are reserved for high priority channels. Write Port ThreadID 0 is reserved for high priority channels.</p> <p>0x3: Read PortThreadID 0, ThreadID 1 and ThreadID 2 are reserved for high priority channels. Write Port ThreadID 0 is reserved for high priority channels.</p>	RW	0x0
11:8	RESERVED	Reserved. Write 0s for future compatibility. Read returns 0.	RW	0x0
7:0	MAX_CHANNEL_FIFO_DEPTH	<p>Maximum FIFO depth allocated to one logical channel. Maximum FIFO depth can not be 0x0. It should be at least 0x1 or greater. Note that If channel limit is less than destination burst size enough data will not be accumulated in the data FIFO and it will never be sent out on the WR port. The burst size should be less than the FIFO limit specified in this bit field.</p>	RW	0x10

Table 9-33. DMA4_CCRi

Address Offset	0x0000 0080 + (i* 0x60)	Index	i = 0 to 31
Physical Address	0x4805 6080 + (i* 0x60)	Instance	SDMA
Description	Channel Control Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								WRITE_PRIORITY	BUFFERING_DISABLE	SEL_SRC_DST_SYNC	PREFETCH	SUPERVISOR	RESERVED	SYNCHRO_CONTROL_UPPER	BS	TRANSPARENT_COPY_ENABLE	CONST_FILL_ENABLE	DST_AMODE	SRC_AMODE	RESERVED	WR_ACTIVE	RD_ACTIVE	SUSPEND_SENSITIVE	ENABLE	READ_PRIORITY	FS	SYNCHRO_CONTROL				

Bits	Field Name	Description	Type	Reset
31:27	RESERVED	Reserved. Write 0s for future compatibility. Read returns 0.	RW	0x00
26	WRITE_PRIORITY	Channel priority on the Write side 0x0: Channel has low priority on the Write side during the arbitration process 0x1: Channel has high priority on Write sided during the arbitration process	RW	0x0
25	BUFFERING_DISABLE	This bit allows to disable the default buffering functionality when transfer is source synchronized. 0x0: buffering is enable across element/packet when source is synchronized to element, packet, frame or blocks 0x1: buffering is disabled across element/packet when source is synchronized to element, packet, frame or blocks	RW	0x-
24	SEL_SRC_DST_SYNC	Specifies that element, packet, frame or block transfer (depending on CCR.bs and CCR.fs) is triggered by the source or the destination on the DMA request 0x0: Transfer is triggered by the destination. If synch on packet the packet element number is specified in the CDFI register 0x1: Transfer is triggered by the source. If synchronized on packet the packet element number is specified in the CSFI register	RW	0x-
23	PREFETCH	Enables the prefetch mode 0x0: Prefetch mode is disabled. When Sel_Src_Dst_Sync=1 transfers are buffered and pipelined between DMA requests 0x1: Prefetch mode is enabled. Prefetch mode is active only when destination is synchronized. It is SW user responsibility not to have at the same time Prefetch=1 when Sel_Src_Dst_Sync=1. This mode is not supported	RW	0x0
22	SUPERVISOR	Enables the supervisor mode 0x0: Supervisor mode is disabled 0x1: Supervisor mode is enabled	RW	0x0
21	RESERVED	Reserved for non-GP devices	RW	0x0
20:19	SYNCHRO_CONTROL_UPPER	Channel Synchronization control upper (used in conjunction with the 5 bits of synchro channel DMA4_CCRi[4:0]) Used in conjunction, as two msb, with the five bits of the synchro channel bit field.	RW	0x0

Bits	Field Name	Description	Type	Reset
18	BS	Block synchronization This bit used with the fs to see how the DMA request is serviced in a synchronized transfer	RW	0x-
17	TRANSPARENT_COPY_ENABLE	Transparent copy enable 0x0: Transparent copy mode is disabled 0x1: Transparent copy mode is enabled	RW	0x-
16	CONST_FILL_ENABLE	Constant fill enable 0x0: Constant fill mode is disabled 0x1: Constant fill mode is enabled	RW	0x0
15:14	DST_AMODE	Selects the addressing mode on the Write Port of a channel. 0x0: Constant address mode 0x1: Post-incremented address mode 0x2: Single index address mode 0x3: Double index address mode	RW	0x-
13:12	SRC_AMODE	Selects the addressing mode on the Read Port of a channel. 0x0: Constant address mode 0x1: Post-incremented address mode 0x2: Single index address mode 0x3: Double index address mode	RW	0x-
11	RESERVED	Reserved. Write 0s for future compatibility. Read returns 0.	RW	0x0
10	WR_ACTIVE	Indicates if the channel write context is active or not 0x0: Channel is not active on the write port 0x1: Channel is active on the write port	R	0x0
9	RD_ACTIVE	Indicates if the channel read context is active or not 0x0: Channel is not active on the read port 0x1: Channel is currently active on the read port	R	0x0
8	SUSPEND_SENSITIVE	Logical channel suspend enable bit 0x0: The channel ignores the MSuspend even if EMUFree is set to 0. 0x1: If EMUFree is set to 0 and MSuspend comes in then all current OCP services (single transaction or burst transaction as specified in the corresponding CSDP register) have to be completed before stopping processing any more transactions	RW	0x0
7	ENABLE	Logical channel enable. It is SW responsibility to clear the CSR register and the IRQSTATUS bit for the different interrupt lines before enabling the channel. 0x0: The logical channel is disabled 0x1: The logical channel is enabled	RW	0x0
6	READ_PRIORITY	Channel priority on the read side 0x0: Channel has low priority on the Read side during the arbitration process 0x1: Channel has high priority on read sided during the arbitration process	RW	0x0
5	FS	Frame synchronization This bit used with the BS to see how the DMA request is serviced in a synchronized transfer FS=0 and BS=0: An element is transferred once a DMA request is made. FS=0 and BS=1: An entire block is transferred once a DMA request is made. FS=1 and BS=0: An entire frame is transferred once a DMA request is made. FS=1 and BS=1: A packet is transferred once a DMA request is made. All these different transfers can be interleaved on the port with other DMA requests.	RW	0x-

Bits	Field Name	Description	Type	Reset
4:0	SYNCHRO_CONTROL	<p>Channel synchronization control</p> <p>This bit field used with the second_level_synchro_control_upper (as two msb)</p> <p>0000000 : Is reserved for non synchronized LCH transfer xxxxxxx (from 1 to 127)</p> <p>There are 127 possible DMA request to assign to any LCH.</p> <p>Note: The channel synchronization control registers are 1-based. For example, to enable the S_DMA_1 request, SYNCHRO_CONTROL bits (formed by DMA_CCRi[20:19] and DMA4_CCRi[4:0]) must be set to 0x2 (DMA request number + 1).</p>	RW	0x0

Table 9-35. DMA4_CLNK_CTRLi

Address Offset	0x0000 0084 + (i* 0x60)	Index	i = 0 to 31
Physical Address	0x4805 6084 + (i* 0x60)	Instance	SDMA
Description	Channel Link Control Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																ENABLE_LNK	RESERVED										NEXTLCH_ID				

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	Reserved. Write 0s for future compatibility. Read returns 0.	RW	0x0000
15	ENABLE_LNK	Enables or disable the channel linking. 0x0: Channel linking mode is disabled. When set on the fly to 0 the current channel will complete the transfer and stops the chain linking. 0x1: Channel linking mode is enabled. The logical channel defined in the NextLCH_ID is enabled at the end of the current transfer.	RW	0x0
14:5	RESERVED	Reserved. Write 0s for future compatibility. Read returns 0.	RW	0x000
4:0	NEXTLCH_ID	Defines the NextLCh_ID, which is used to build logical channel chaining queue.	RW	0x-

Interrupt Controller

This chapter gives an overview of the interrupt controllers (INTCs) and describes in detail the MPU subsystem interrupt controller (MPU_INTC) module.

NOTE: Some features may not be available or supported in your particular device. For more information, see Chapter 1, the Device Family section, and your device-specific data manual.

Topic	Page
10.1 Interrupt Controller Overview	1038
10.2 Interrupt Controller Environment	1040
10.3 MPU Subsystem INTCPS Integration	1041
10.4 Interrupt Controller Functional Description	1045
10.5 Interrupt Basic Programming Model	1049
10.6 Interrupt Controller Register Manual	1057

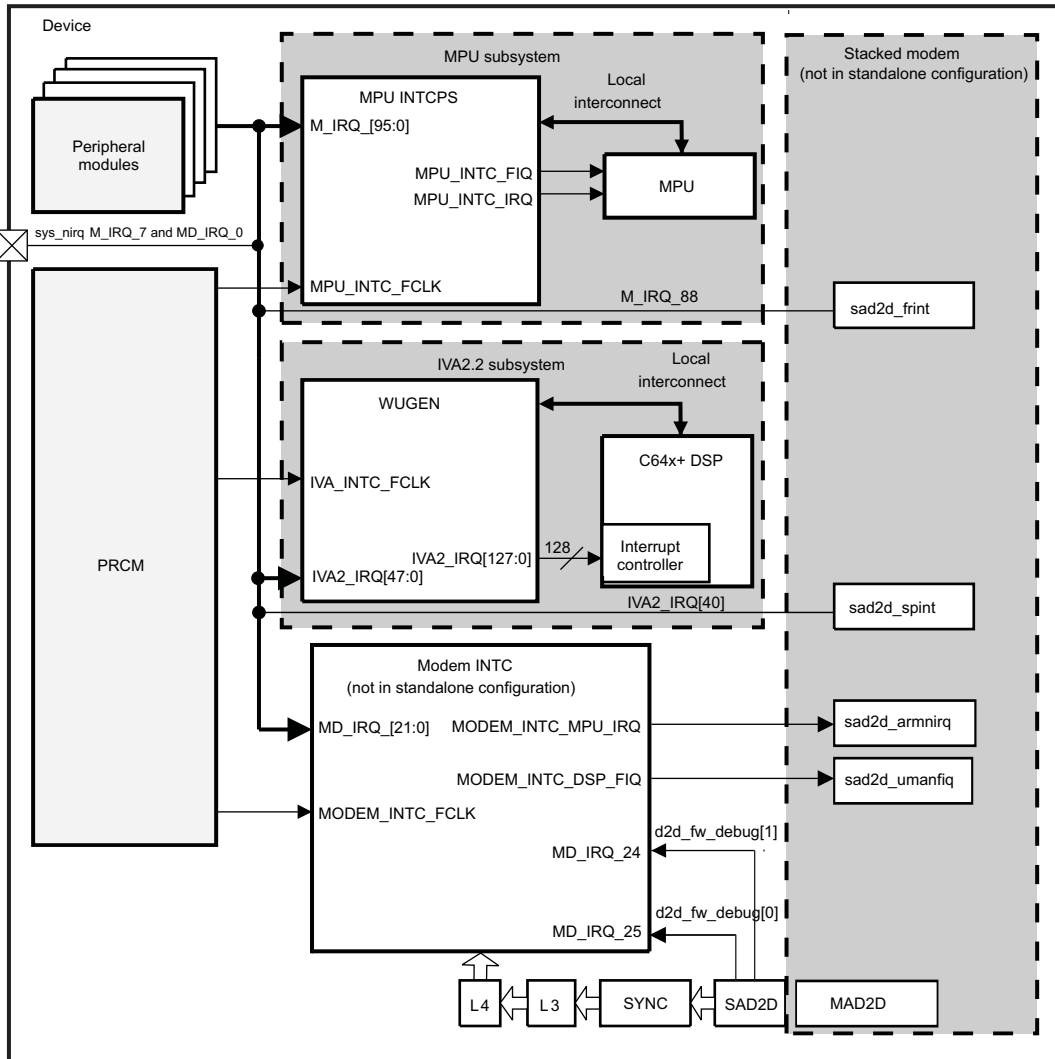

10.1 Interrupt Controller Overview

The device provides three interrupt controller (INTC) modules:

- **MPU subsystem INTC (INTCPS):** This module handles all MPU-related events, using Priority Threshold. It communicates with the public ARM Cortex-A8 processor using a private local interconnect, and runs at half the speed of the processor.
- **IVA2.2 subsystem INTC:** This module is a specific combination of WUGEN (wake-up generator) and the C64x+ DSP interrupt controller (IC). It is used in the device, but is not described in detail in this chapter. For detailed information about this INTC, see [Chapter 14, IVA2.2 Subsystem](#).
- **Modem INTC:** This module is an L4-mapped INTC that allows the regrouping of all the interrupts sent to the modem subsystem in stacked mode. It is seen as a level 2 INTC by the MPU and IVA2.2 subsystems. This modem INTC is integrated in the stand-alone device, but it is used only with the stacked modem. Therefore, it is not described in detail in this TRM, which focuses on the stand-alone device.

[Figure 10-1](#) shows the internal interrupt scheme with optional modem INTC (not used in the stand-alone configuration).

Figure 10-1. Interrupt Controllers Highlight

108-001

10.2 Interrupt Controller Environment

The INTC can handle two types of interrupts originating from an external device:

- **sys_nirq** interrupt inputs:

The MPU INTC and modem INTC handle external interrupts through a dedicated **sys_nirq** interrupt line that connects the two INTC modules with a power IC, respectively. An interrupt can generate a system wake-up event.

If the system is idle and the external interrupt is masked, the interrupt cannot wake up the system. Like other interrupt lines, the external interrupt is active at low level and is acknowledged by the software according to the common programming model.

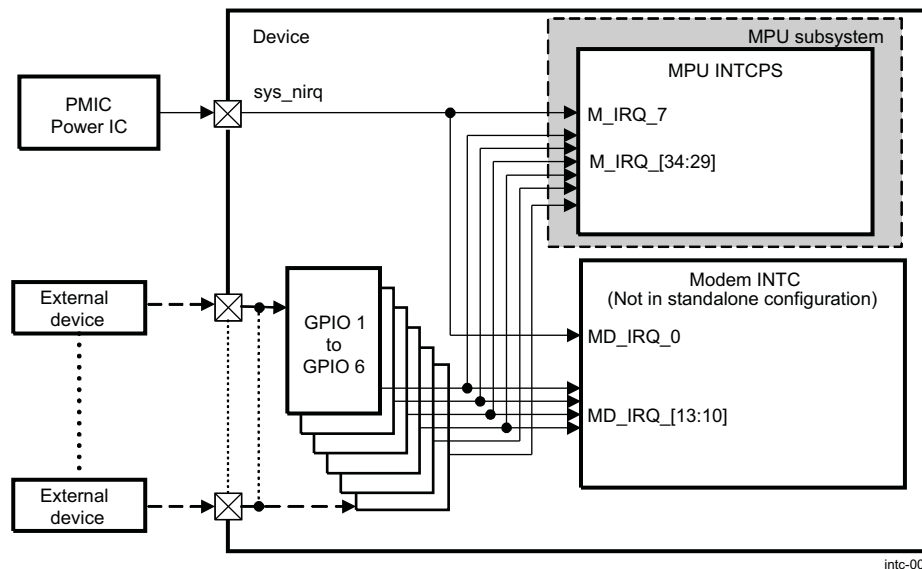

NOTE: If the CORE power domain is in retention (CSWR or OSWR) or off mode, the interrupt requests (internal or external), the MPU INTC, and the modem INTC (in the CORE domain) have no effect. The CORE power domain does not wake up, and the interrupt is not signaled to the MPU/modem.

- **GPIO** interrupt inputs:

External devices can also use GPIO modules to generate interrupts to the MPU and the modem. There are six dedicated interrupt lines to the MPU INTC and four dedicated interrupt inputs to the modem INTC. One interrupt line is associated with each GPIO module. Each GPIO module can generate a single interrupt whenever there is at least one event in any one of the configured 32 GPIO inputs. For more information about GPIO features, see [Chapter 24, General-Purpose Interface](#).

[Figure 10-2](#) shows the relationship between the device and external interrupts.

Figure 10-2. Interrupts From External Devices

NOTE: The modem INTC cannot use GPIO5 and GPIO6 as interrupt sources.

The features specific to INTCPS are:

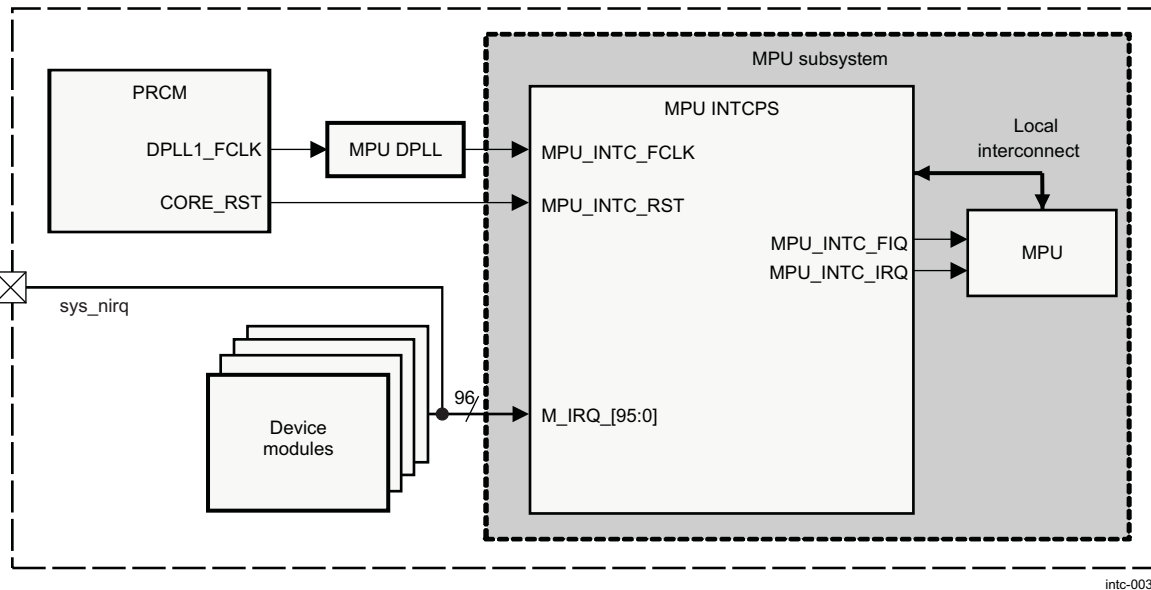

- Up to 96 level-sensitive interrupt inputs
- Individual priority (up to 64) for each interrupt input
- Interrupt lines connected to internal module interrupts
- One incoming interrupt line from an external device

10.3 MPU Subsystem INTCPS Integration

The INTCPS module is the interface between incoming interrupts and the two interrupt inputs of the MPU. It can handle up to 96 request inputs that can be configured as MPU FIQ or IRQ interrupt requests.

Figure 10-3 shows the integration of the INTCPS in the MPU subsystem.

Figure 10-3. MPU Subsystem INTCPS Integration

The MPU subsystem INTCPS is directly connected to the MPU by an MPU peripheral port. Consequently, the MPU subsystem INTCPS is accessible and visible only by the MPU.

10.3.1 Clocking, Reset, and Power Management Scheme

10.3.1.1 MPU Subsystem INTC Clocks

The MPU subsystem INTCPS runs at half the rate of the MPU functional clock (see Chapter 3, MPU Subsystem).

The interface clock used for register access runs at the rate of the interconnect bus clock (equal to the rate of the MPU interface clock; see Chapter 4, Power, Reset, and Clock Management).

The synchronizer clock allows external asynchronous interrupts to be resynchronized before they are masked.

Table 10-1 lists the MPU subsystem INTC clock rates.

Table 10-1. MPU Subsystem INTC Clock Rates

Clock	Frequency	Name	Comments
Functional	ARM_FCLK	MPU_INTC_FCLK	Source is the MPU DPLL.
Interface	ARM_FCLK	MPU_INTC_ICLK	Source is the PRCM module.
Synchronizer	MPU_INTC_FCLK	Synchronizer clock (module internal clock)	Source is the MPU_INTC_FCLK.

10.3.1.2 Hardware and Software Reset

Table 10-2 lists the MPU subsystem INTC resets.

Table 10-2. Hardware and Software Reset

Type	Name	Source	Activation	Domain
Hardware	CORE_RST	PRCM	Active low	CORE
Software	SOFTRESET	MPU_INTC.INTCPS_SYSCONFIG[1] SOFTRESET bit	Active at 1	MPU INTC internal

10.3.1.3 Power Management

The MPU subsystem INTC belongs to the CORE power domain. As part of CORE power domain, it is sensitive to a CORE_RST issued by the PRCM. For more information about the CORE power domain implementation and CORE_RST signal, see [Chapter 4, Power, Reset, and Clock Management](#).

The MPU INTC clocks come from the MPU DPLL. For more information about these clocks control, see [Chapter 3, MPU Subsystem](#).

10.3.2 Interrupt Request Lines

[Table 10-3](#) lists the incoming and outgoing interrupt lines of the INTCPS.

Table 10-3. Interrupt Lines Incoming and Outgoing

Type	Number	Name	Mapping	Comments
Interrupt request inputs	Up to 96	M_IRQ_[95:0]	See Table 10-4	Inputs to INTCPS module, source from various modules.
Interrupt request outputs	2	MPU_INTC_FIQ	MPU_INTC_FIQ	Outgoing to MPU Fast Interrupt
		MPU_INTC_IRQ	MPU_INTC_IRQ	Outgoing to MPU Normal Interrupt

NOTE: Interrupt request signals are active at low level.

CAUTION

A single interrupt source can be physically mapped to multiple INTCs (MPU subsystem, IVA2.2 subsystem, and modem). With multiple-mapped interrupts, it is strongly recommended each interrupt source be unmasked in only one INTC at a time.

This section gives information about all modules and features in the high-tier device. See [Section 1.5, OMAP35xx Family](#), to check availability of modules and features. Ensure that interrupts of unavailable modules and features are masked in MPU subsystem.

[Table 10-4](#) lists interrupt mappings to the MPU subsystem.

Table 10-4. Interrupt Mapping to the MPU Subsystem⁽¹⁾

IRQ	Source	Description
M_IRQ_0	EMUINT	MPU emulation ⁽²⁾

10.4 Interrupt Controller Functional Description

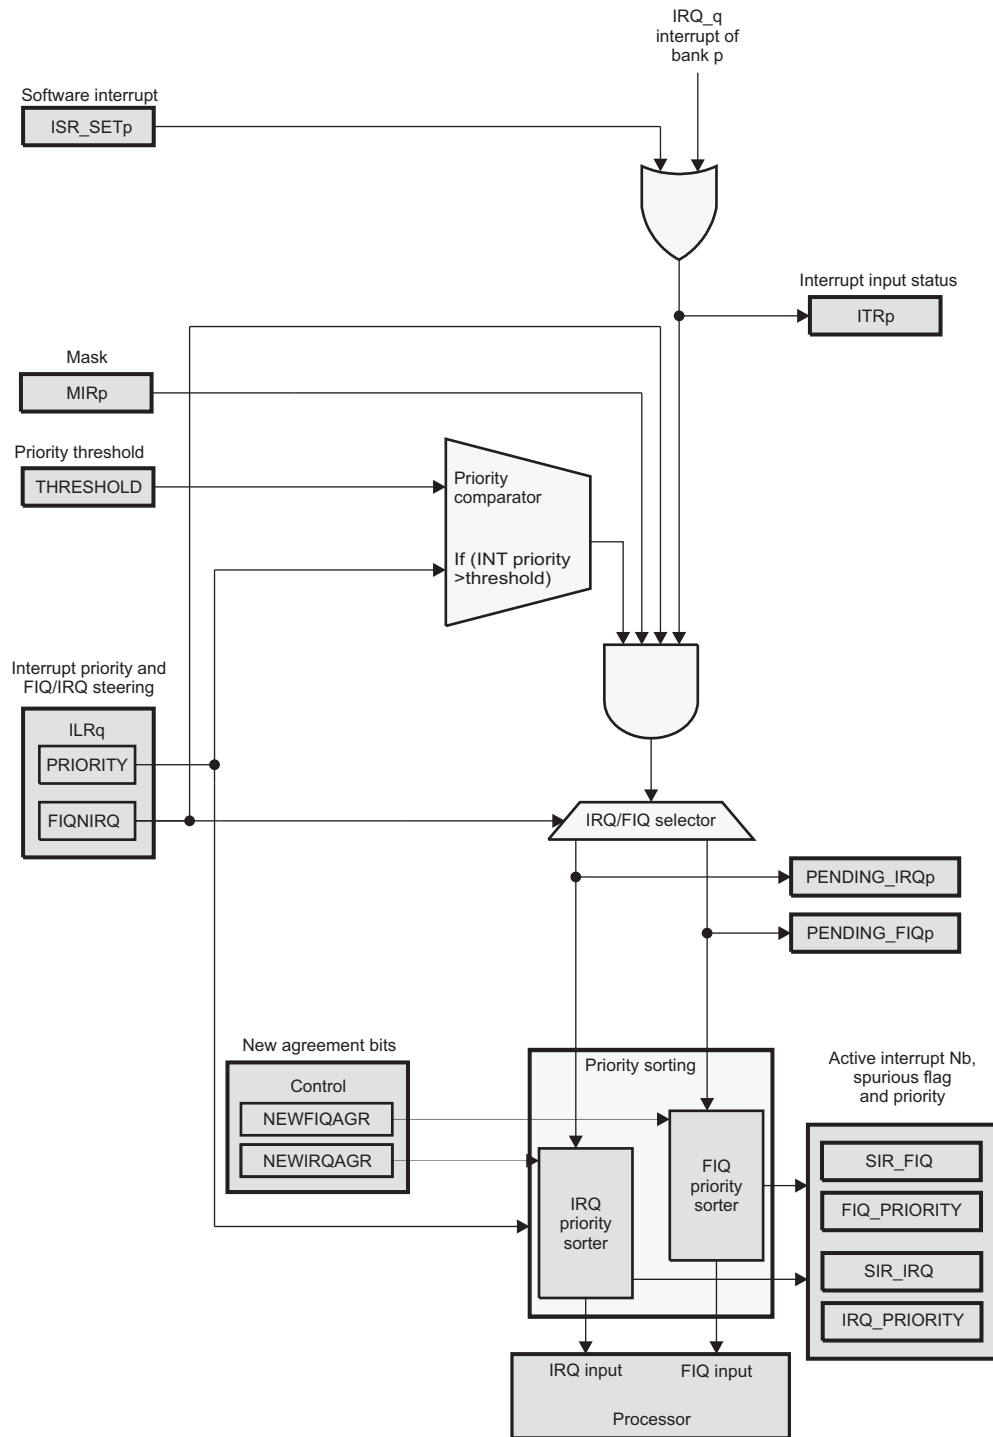

The main features of the INTCPS are:

- Individual priority (up to 64 levels) for each interrupt input
- Ability for each interrupt to be steered to either FIQ or IRQ
- Independent priority sorting for FIQ and IRQ; FIQ sorting is processed concurrently with IRQ sorting.
- Priority masking: Interrupts can be masked based on the priority threshold register.
- Atomic bit set and clear capability for interrupt mask and software interrupt registers
- Power-management and wake-up support
- Auto-idle power-saving support

The INTCPS processes incoming interrupts by masking and priority sorting, then it generates the interrupt requests to the MPU.

[Figure 10-4](#) shows the top-level view of the interrupt processing.

Figure 10-4. Top-Level Block Diagram

intc-004

10.4.1 Interrupt Processing

10.4.1.1 Input Selection

The INTCPS supports only level-sensitive incoming interrupt detection. A peripheral asserting an interrupt maintains it until software has handled the interrupt and instructed the peripheral to deassert the interrupt.

A software interrupt is generated if the corresponding bit in the MPU_INTC.INTCPS_ISR_SETn register is set (register bank number: n = [0,2] for the MPU subsystem INTCPS, 96 incoming interrupt lines are supported). The software interrupt clears when the corresponding bit in the MPU_INTC.INTCPS_ISR_CLEARn register is written. Typical use of this feature is software debugging.

10.4.1.2 Masking

10.4.1.2.1 Individual Masking

Detection of interrupts on each incoming interrupt line can be enabled or disabled independently by the MPU_INTC.INTCPS_MIRn interrupt mask register. In response to an unmasked incoming interrupt, the INTCPS can generate one of two types of interrupt requests to the processor:

- IRQ: low-priority interrupt request
- FIQ: fast interrupt request

The type of interrupt request is determined by the MPU_INTC.INTCPS_ILRm[0] FIQNIRQ bit (m= [0,95]).

The current incoming interrupt status before masking is readable from the MPU_INTC.INTCPS_ITRn register. After masking and IRQ/FIQ selection, and before priority sorting is done, the interrupt status is readable from the MPU_INTC.INTCPS_PENDING_IRQn and MPU_INTC.INTCPS_PENDING_FIQn registers.

10.4.1.2.2 Priority Masking

To enable faster processing of high-priority interrupts, a programmable priority masking threshold is provided (the MPU_INTC.INTCPS_THRESHOLD[7:0] PRIORITYTHRESHOLD field). This priority threshold allows preemption by higher priority interrupts; all interrupts of lower or equal priority than the threshold are masked. However, priority 0 can never be masked by this threshold; a priority threshold of 0 is treated the same way as priority 1.

PRIORITY and PRIORITYTHRESHOLD fields values can be set between 0x0 and 0x3F; 0x0 is the highest priority and 0x3F is the lowest priority.

When priority masking is not necessary, a priority threshold value of 0xFF disables the priority threshold mechanism. This value is also the reset default for backward compatibility with previous versions of the INTCPS.

10.4.1.3 Priority Sorting

A priority level (0 being the highest) is assigned to each incoming interrupt line. Both the priority level and the interrupt request type are configured by the MPU_INTC.INTCPS_ILRm register. If more than one incoming interrupt with the same priority level and interrupt request type occur simultaneously, the highest-numbered interrupt is serviced first.

When one or more unmasked incoming interrupts are detected, the INTCPS separates between IRQ and FIQ using the corresponding MPU_INTC.INTCPS_ILRm[0] FIQNIRQ bit. The result is placed in INTCPS_PENDING_IRQn or INTCPS_PENDING_FIQn

If no other interrupts are currently being processed, INTCPS asserts IRQ/FIQ and starts the priority computation. Priority sorting for IRQ and FIQ can execute in parallel.

Each IRQ/FIQ priority sorter determines the highest priority interrupt number. Each priority number is placed in the corresponding MPU_INTC.INTCPS_SIR_IRQ[6:0] ACTIVEIRQ field or MPU_INTC.INTCPS_SIR_FIQ[6:0] ACTIVEFIQ field. The value is preserved until the corresponding MPU_INTC.INTCPS_CONTROL NEWIRQAGR or NEWFIQAGR bit is set.

Once the interrupting peripheral device has been serviced and the incoming interrupt deasserted, the user must write to the appropriate NEWIRQAGR or NEWFIQAGR bit to indicate to the INTCPS the interrupt has been handled. If there are any pending unmasked incoming interrupts for this interrupt request type, the INTCPS restarts the appropriate priority sorter; otherwise, the IRQ or FIQ interrupt line is deasserted.

10.4.2 Register Protection

If the MPU_INTC.INTCPS_PROTECTION[0] PROTECTION bit is set, access to the INTCPS registers is restricted to the supervisor mode. Access to the MPU_INTC.INTCPS_PROTECTION register is always restricted to privileged mode.

10.4.3 Module Power Saving

The INTCPS provides an auto-idle function in its three clock domains:

- Interface clock
- Functional clock
- Synchronizer clock

The interface clock auto-idle power-saving mode is enabled if the MPU_INTC.INTCPS_SYSCONFIG[0] AUTOIDLE bit is set to 1. When this mode is enabled and there is no activity on the bus interface, the interface clock is disabled internally to the module, thus reducing power consumption. When there is new activity on the bus interface, the interface clock restarts without any latency penalty. After reset, this mode is disabled, by default.

The functional clock auto-idle power-saving mode is enabled if the MPU_INTC.INTCPS_IDLE[0] FUNCIDLE bit is set to 0. When this mode is enabled and there is no active interrupt (IRQ or FIQ interrupt being processed or generated) or no pending incoming interrupt, the functional clock is disabled internally to the module, thus reducing power consumption. When a new unmasked incoming interrupt is detected, the functional clock restarts and the INTCPS processes the interrupt. If this mode is disabled, the interrupt latency is reduced by one cycle. After reset, this mode is enabled, by default.

The synchronizer clock allows external asynchronous interrupts to be resynchronized before they are masked. The synchronizer input clock has an auto-idle power-saving mode enabled if the MPU_INTC.INTCPS_IDLE[1] TURBO bit is set to 1. If the auto-idle mode is enabled, the standby power is reduced, but the IRQ or FIQ interrupt latency increases from four to six functional clock cycles. This feature can be enabled dynamically according to the requirements of the device. After reset, this mode is disabled, by default.

To reduce power consumption of the modem INTC, which is not used in the stand-alone device, modem INTC clocks must be configured in auto-idle mode. Therefore, both the MPU_INTC.INTCPS_SYSCONFIG[0] AUTOIDLE and MPU_INTC.INTCPS_IDLE[1] TURBO bits must be set to 1 during initialization.

10.4.4 Interrupt Latency

The IRQ/FIQ interrupt generation takes four INTCPS functional clock cycles (plus or minus one cycle) if the MPU_INTC.INTCPS_IDLE[1] TURBO bit is set to 0. If the TURBO bit is set to 1, the interrupt generation takes six cycles, but power consumption is reduced while waiting for an interrupt.

These latencies can be reduced by one cycle by disabling functional clock auto-idle (MPU_INTC.INTCPS_IDLE[0] FUNCIDLE bit set to 1), but power consumption is increased, so the benefit is minimal. For information about power saving, see [Section 10.4.3](#).

To minimize interrupt latency when an unmasked interrupt occurs, the IRQ or FIQ interrupt is generated before priority sorting completion. The priority sorting takes 10 functional clock cycles, which is less than the minimum number of cycles required for the MPU to switch to the interrupt context after reception of the IRQ or FIQ event.

Any read of the MPU_INTC.INTCPS_SIR_IRQ or MPU_INTC.INTCPS_SIR_FIQ register during the priority sorting process stalls until priority sorting is complete and the relevant register is updated. However, the delay between the interrupt request being generated and the interrupt service routine being executed is such that priority sorting always completes before the MPU_INTC.INTCPS_SIR_IRQ or MPU_INTC.INTCPS_SIR_FIQ register is read.

10.5 Interrupt Basic Programming Model

10.5.1 Initialization Sequence

1. Program the MPU_INTC.INTCPS_SYSCONFIG register: If necessary, enable the interface clock autogating by setting the AUTOIDLE bit.
2. Program the MPU_INTC.INTCPS_IDLE register: If necessary, disable functional clock autogating or enable synchronizer autogating by setting the FUNCIDLE bit or TURBO bit accordingly.
3. Program the MPU_INTC.INTCPS_ILRm register for each interrupt line: Assign a priority level and set the FIQNFIQ bit for an FIQ interrupt (by default, interrupts are mapped to IRQ and priority is 0x0 [highest]).
4. Program the MPU_INTC.INTCPS_MIRn register: Enable interrupts (by default, all interrupt lines are masked).

NOTE: To program the MPU_INTC.INTCPS_MIRn register, the MPU_INTC.INTCPS_MIR_SETn and MPU_INTC.INTCPS_MIR_CLEARn registers are provided to facilitate the masking, even if it is possible for backward-compatibility to write directly to the MPU_INTC.INTCPS_MIRn register.

10.5.2 MPU INTC Processing Sequence

After the MPU_INTC.INTCPS_MIRn and MPU_INTC.INTCPS_ILRm registers are configured to enable and assign priorities to incoming interrupts, the interrupt is processed as explained in the following subsections.

IRQ and FIQ processing sequences are quite similar, the differences for the FIQ sequence are shown after a '/' character in **bold** characters in the text or the code below.

1. One or more unmasked incoming interrupts (M_IRQ_n signals) are received and IRQ or FIQ outputs (MPU_INTC_IRQ/**FIQ**) are not currently asserted.
2. If the MPU_INTC.INTCPS_ILRm[0] FIQNIRQ bit is set to 0, the MPU_INTC_IRQ output signal is generated. If the FIQNIRQ bit is set to 1, the MPU_INTC_FIQ output signal is generated.
3. The INTC performs the priority sorting and updates the MPU_INTC.INTCPS_SIR_IRQ[6:0] ACTIVEIRQ /**MPU_INTC.INTCPS_SIR_FIQ[6:0] ACTIVEFIQ** field with the current interrupt number.
4. During priority sorting, if the IRQ/**FIQ** is enabled at the host processor side, the host processor automatically saves the current context and executes the ISR as follows:

NOTE: The ARM host processor automatically performs the following actions in pseudo code.

```

LR = PC + 4                               /* return link          */
SPSR = CPSR                               /* Save CPSR before execution */
CPSR[5] = 0                               /* Execute in ARM state    */
CPSR[7] = 1                               /* Disable IRQ            */
CPSR[8] = 1                               /* Disable Imprecise Data Aborts */
CPSR[9] = CP15_reg1_EEbit                 /* Endianness on exception entry */
if interrupt == IRQ then
    CPSR[4:0] = 0b10010                   /* Enter IRQ mode        */
    if high vectors configured then
        PC = 0xFFFF0018
    else
        PC = 0x00000018                   /* execute interrupt vector */
else if interrupt == FIQ then

```

```

CPSR[4:0] = 0b10001          /* Enter FIQ mode          */
CPSR[6] = 1                  /* Disable FIQ            */
if high vectors configured then
    PC = 0xFFFF001C
else
    PC = 0x0000001C          /* execute interrupt vector */
endif

```

5. The ISR saves the remaining context, identifies the interrupt source by reading the **ACTIVEIRQ/ACTIVEFIQ** field, and jumps to the relevant subroutine handler as follows:

CAUTION

The code in steps 5 and 7 is an assembly code compatible with ARM architecture V6 and V7. This code is developed for the Texas Instruments Code Composer Studio tool set. It is a draft version, only tested on an emulated environment.

```

; INTCPS_SIR_IRQ/INTCPS_SIR_FIQ register address
INTCPS_SIR_IRQ_ADDR/INTCPS_SIR_FIQ_ADDR .word 0x48200040/0x48200044

; ACTIVEIRQ bit field mask to get only the bit field
ACTIVEIRQ_MASK .equ 0x7F
_IRQ_ISR/_FIQ_ISR:

    ; Save the critical context
    STMFD SP!, {R0-R12, LR}          ; Save working registers and the Link register

    MRS R11, SPSR                   ; Save the SPSR into R11

    ; Get the number of the highest priority active IRQ/FIQ
    LDR R10, INTCPS_SIR_IRQ_ADDR/INTCPS_SIR_FIQ_ADDR
    LDR R10, [R10]                   ; Get the INTCPS_SIR_IRQ/INTCPS_SIR_FIQ register
    AND R10, R10, #ACTIVEIRQ_MASK    ; Apply the mask to get the active IRQ number

    ; Jump to relevant subroutine handler
    LDR PC, [PC, R10, lsl #2]        ; PC base address points this instruction + 8

    NOP                               ; To index the table by the PC

    ; Table of handler start addresses
    .word IRQ0handler ;For IRQ0 of BANK0
    .word IRQ1handler
    .word IRQ2handler

```

6. The subroutine handler executes code specific to the peripheral generating the interrupt by handling the event and deasserting the interrupt condition at the peripheral side.

```

; IRQ0 subroutine
IRQ0handler:

    ; Save working registers
    STMFD SP!, {R0-R1}

    ; Now read-modify-write the peripheral module status register
    ; to de-assert the M_IRQ_0 interrupt signal

    ; De-Assert the peripheral interrupt

    MOV R0, #0x7                    ; Mask for 3 flags
    LDR R1, MODULE0_STATUS_REG_ADDR ; Get the address of the module Status Register
    STR R0, [R1]                     ; Clear the 3 flags

    ; Restore working registers      LDMFD SP!, {R0-R1}
    ; Jump to the end part of the ISR

```

B IRQ_ISR_end/**FIQ_ISR_end**

- After the return of the subroutine, the ISR sets the **NEWIRQAGR/NEWFIQAGR** bit to enable the processing of subsequent pending **IRQs/FIQs** and to restore ARM context in the following code. Because the writes are posted on an Interconnect bus, to be sure that the preceding writes are done before enabling **IRQs/FIQs**, a Data Synchronization Barrier is used. This operation ensure that the **IRQ/FIQ** line is de-asserted before **IRQ/FIQ** enabling. After that, the INTC processes any other pending interrupts or deasserts the **MPU_INTC_IRQ/MPU_INTC_FIQ** signal if there is no interrupt.

```

; INTCPS_CONTROL register address
INTCPS_CONTROL_ADDR .word 0x48200048;

NEWIRQAGR/NEWFIQAGR bit mask to set only the NEWIRQAGR/NEWFIQAGR bit
NEWIRQAGR_MASK/NEWFIQAGR_MASK .equ 0x01/0x02

IRQ_ISR_end/FIQ_ISR_end:

    ; Allow new IRQs/FIQs at INTC side
    ; The INTCPS_CONTROL register is a write only register so no need to write back others bits

MOV R0, #NEWIRQAGR_MASK/NEWFIQAGR_MASK ; Get the NEWIRQAGR/NEWFIQAGR bit position
LDR R1, INTCPS_CONTROL_ADDR
STR R0, [R1] ; Write the NEWIRQAGR/NEWFIQAGR bit to allow new
IRQs/FIQs

    ; Data Synchronization Barrier
MOV R0, #0
MCR P15, #0, R0, C7, C10, #4

    ; restore critical context
MSR SPSR, R1 ; Restore the SPSR from R1
LDMFD SP!, {R0-R12, LR} ; Restore working registers and
Link register

    ; Return after handling the interrupt
SUBS PC, LR, #4

```

- After the ISR return, the ARM automatically restores its context as follows:

```

CPSR = SPSR
PC = LR

```

Figure 10-5 shows the **IRQ/FIQ** processing sequence from the originating device peripheral module to the main program interruption.

Figure 10-5. IRQ/FIQ Processing Sequence

108-005

NOTE: The differences between the IRQ and the FIQ sequence are highlighted in blue and bold characters.

The priority sorting mechanism is frozen during an interrupt processing sequence. If an interrupt condition occurs during this time, the interrupt is not lost. It is sorted when the **NEWIRQAGR/NEWFIQAGR** bit is set (priority sorting is reactivated).

10.5.3 MPU INTC Preemptive Processing Sequence

Preemptive interrupts, also called nested interrupts, can reduce the latencies for higher priority interrupts. A preemptive ISR can be suspended by a higher priority interrupt. Thus, the higher priority interrupt can be served immediately.

Nested interrupts must be used carefully to avoid using corrupted data. Programmers must save corruptible registers and enable IRQ or FIQ at ARM side.

IRQ and FIQ processing sequences are quite similar, the differences for the FIQ sequence are shown after a '/' character in **bold** characters in the text or the code below.

To enable IRQ/**FIQ** preemption by higher priority IRQs/**FIQs**, programers can follow this procedure to write the ISR:

At the beginning of an IRQ/**FIQ** ISR:

1. Save the ARM critical context registers.
2. Save the MPU_INTC.**INTCPS_THRESHOLD** PRIORITYTHRESHOLD field before modifying it.
3. Read the active interrupt priority in the MPU_INTC.**INTCPS_IRQ_PRIORITY** IRQPRIORITY / **MPU_INTC.INTCPS_FIQ_PRIORITY** FIQPRIORITY field and write it to the PRIORITYTHRESHOLD⁽¹⁾ field.
4. Read the active interrupt number in the MPU_INTC.**INTCPS_SIR_IRQ**[6:0] ACTIVEIRQ / **MPU_INTC.INTCPS_SIR_FIQ**[6:0] ACTIVEFIQ field to identify the interrupt source.
5. Write 1 to the appropriate MPU_INTC.**INTCPS_CONTROL** NEWIRQAGR and ⁽²⁾ **NEWFIQAGR** bit while an interrupt is still processing to allow only higher priority interrupts to preempt.
6. Because the writes are posted on an Interconnect bus, to be sure that the preceding writes are done before enabling IRQs/**FIQs**, a Data Synchronization Barrier is used. This operation ensure that the IRQ line is de-asserted before IRQ/**FIQ** enabling.
7. Enable IRQ/**FIQ** at ARM side.
8. Jump to the relevant subroutine handler.

The sample code below shows the previous steps:

CAUTION

The code below is an assembly code compatible with ARM architecture V6 and V7. This code is developed for the Texas Instruments Code Composer Studio tool set. It is a draft version, only tested on an emulated environment.

```

; bit field mask to get only the bit field
ACTIVEPRIO_MASK .equ 0x3F

_IRQ_ISR:

    ; Step 1 : Save the critical context
    STMFD SP!, {R0-R12, LR}           ; Save working registers
    MRS R11, SPSR                     ; Save the SPSR into R11

    ; Step 2 : Save the INTCPS_THRESHOLD register into R12
    LDR R0, INTCPS_THRESHOLD_ADDR
    LDR R12, [R0]

```

- ⁽¹⁾ The priority-threshold mechanism is enabled automatically when writing a priority in the range of 0x00 to 0x3F while reading it from the IRQPRIORITY and FIQPRIORITY fields. Writing a value of 0xFF (reset default) disables the priority-threshold mechanism. Values between 0x3F and 0xFF must not be used. When the hardware-priority threshold is in use, the priorities of interrupts selected as FIQ or IRQ become linked; otherwise, they are independent. When they are linked, all FIQ priorities must be set higher than all IRQ priorities to maintain the relative priority of FIQ over IRQ.
- ⁽²⁾ When handling FIQs using the priority-threshold mechanism, both NEWFIQAGR and NEWIRQAGR bits must be written at the same time to ensure that the new priority threshold is applied while an IRQ sort is in progress. This IRQ will not have been seen by the ARM, as it will have been masked on entry to the FIQ ISR. However, the source of the IRQ remains active and it is finally processed when the priority threshold falls to a priority sufficiently low to allow it to be processed. The precaution of writing to New FIQ Agreement is not required during an IRQ ISR, as FIQ sorting is not affected (providing all FIQ priorities are higher than all IRQ priorities).

```

; Step 3 : Get the priority of the highest priority active IRQ
LDR R1, INTCPS_IRQ_PRIORITY_ADDR/INTCPS_FIQ_PRIORITY_ADDR
LDR R1, [R1] ; Get the
INTCPS_IRQ_PRIORITY/INTCPS_FIQ_PRIORITY register
AND R1, R1, #ACTIVEPRIO_MASK ; Apply the mask to get the priority of the IRQ

STR R1, [R0] ; Write it to the INTCPS_THRESHOLD register

; Step 4 : Get the number of the highest priority active IRQ
LDR R10, INTCPS_SIR_IRQ_ADDR/INTCPS_SIR_FIQ_ADDR
LDR R10, [R10] ; Get the INTCPS_SIR_IRQ/INTCPS_SIR_FIQ register

AND R10, R10, #ACTIVEIRQ_MASK ; Apply the mask to get the active IRQ number

; Step 5 : Allow new IRQs and FIQs at INTC side
MOV R0, #0x1/0x3 ; Get the NEWIRQAGR and NEWFIQAGR bit position
LDR R1, INTCPS_CONTROL_ADDR
STR R0, [R1] ; Write the NEWIRQAGR and NEWFIQAGR bit

; Step 6 : Data Synchronization Barrier
MOV R0, #0 MCR P15, #0, R0, C7, C10, #4

; Step 7 : Read-modify-write the CPSR to enable IRQs/FIQs at ARM side
MRS R0, CPSR ; Read the status register
BIC R0, R0, #0x80/0x40 ; Clear the I/F bit
MSR CPSR, R0 ; Write it back to enable IRQs

; Step 8 : Jump to relevant subroutine handler
LDR PC, [PC, R10, lsl #2] ; PC base address points this instruction + 8
NOP ; To index the table by the PC

; Table of handler start addresses
.word IRQ0handler ;IRQ0 BANK0
.word IRQ1handler
.word IRQ2handler

```

After the return of the relevant IRQ/FIQ subroutine handle :

1. Disable IRQs/FIQs at ARM side.
2. Restore the MPU_INTC.INTCPS_THRESHOLD PRIORITYTHRESHOLD field.
3. Restore the ARM critical context registers.

The sample code below shows the three previous steps:

CAUTION

The code below is an assembly code compatible with ARM architecture V6 and V7. This code is developed for the Texas Instruments Code Composer Studio tool set. It is a draft version, only tested on an emulated environment.

IRQ_ISR_end:

```

; Step 1 : Read-modify-write the CPSR to disable IRQs/FIQs at ARM side
MRS R0, CPSR ; Read the CPSR
ORR R0, R0, #0x80/0x40 ; Set the I/F bit
MSR CPSR, R0 ; Write it back to disable IRQs

; Step 2 : Restore the INTCPS_THRESHOLD register from R12
LDR R0, INTCPS_THRESHOLD_ADDR
STR R12, [R0]

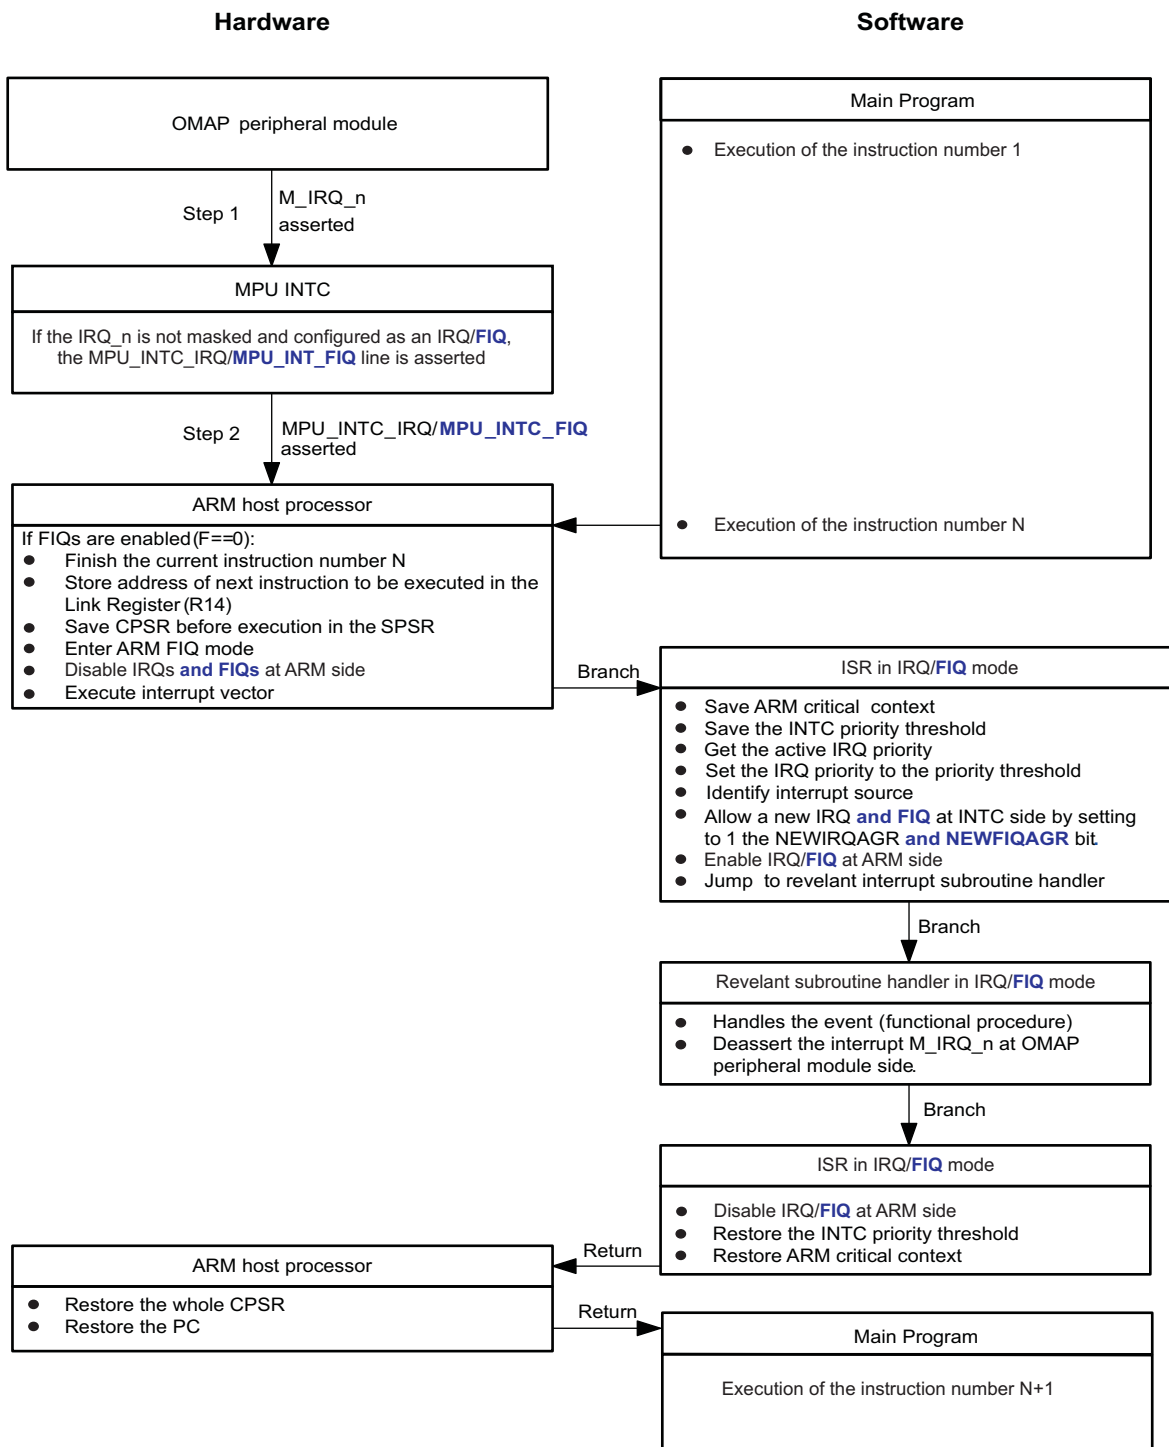

; Step 3 : Restore critical context
MSR SPSR, R11 ; Restore the SPSR from R11
LDMFD SP!, {R0-R12, LR} ; Restore working registers and Link register

; Return after handling the interrupt
SUBS PC, LR, #4

```

Figure 10-6 shows the nested IRQ/FIQ processing sequence from the originating device peripheral module to the main program interruption.

Figure 10-6. Nested IRQ/FIQ Sequence

108-006

NOTE: The differences between the IRQ and the FIQ sequence are highlighted in blue and bold characters.

10.5.4 MPU INTC Spurious Interrupt Handling

The spurious flag indicates whether the result of the sorting (a window of 10 INTC functional clock cycles after the interrupt assertion) is invalid. The sorting is invalid if:

- The interrupt that triggered the sorting is no longer active during the sorting.
- A change in the mask has affected the result during the sorting time.

As a result, the values in the MPU_INTC.INTCPS_MIR_n, MPU_INTC.INTCPS_ILR_m, or MPU_INTC.INTCPS_MIR_SET_n registers must not be changed while the corresponding interrupt is asserted. If these registers are changed within the 10-cycle window after the interrupt assertion, only the active interrupt input that triggered the sort can be masked before its turn in the sort. The resulting values of the following registers become invalid:

- MPU_INTC.INTCPS_SIR_IRQ
- MPU_INTC.INTCPS_SIR_FIQ
- MPU_INTC.INTCPS_IRQ_PRIORITY
- MPU_INTC.INTCPS_FIQ_PRIORITY

This condition is detected for both IRQ and FIQ, and the invalid status is flagged across the SPURIOUSIRQFLAG (see Note 1) and SPURIOUSFIQFLAG (see Note 2) bit fields in the SIR and PRIORITY registers. A 0 indicates valid and a 1 indicates invalid interrupt number and priority. The invalid indication can be tested in software as a false register value.

NOTE:

1. The MPU_INTC.INTCPS_SIR_IRQ[31:7] SPURIOUSIRQFLAG bit field is a copy of the MPU_INTC.INTCPS_IRQ_PRIORITY[31:7] SPURIOUSIRQFLAG bit field.
 2. The MPU_INTC.INTCPS_SIR_FIQ[31:7] SPURIOUSFIQFLAG bit field is a copy of the MPU_INTC.INTCPS_FIQ_PRIORITY[31:7] SPURIOUSFIQFLAG bit field.
-

10.6 Interrupt Controller Register Manual

10.6.1 Instance Summary

Table 10-5 lists the base address and address space for the INTC instances.

Table 10-5. INTC Instance Summary

Module Name	Base Address	Size
MPU INTC	0x4820 0000	4K bytes
Modem INTC	0x480C 7000	4K bytes

10.6.2 Register Summary

CAUTION

MPU INTC and Modem INTC registers are limited to 32-bit and 16-bit data accesses; 8-bit data access is not allowed and can corrupt the register content.

In Section 10.6.3, each register from MPU_INTC.INTCPS_ITR_n to MPU_INTC.INTCPS_PENDING_FIQ_n contains 32 bits, 1 bit for each interrupt (in ascending order: bit 0 of the MPU_INTC.INTCPS_ITR₀ register applies to interrupt line 0; bit 0 of the MPU_INTC.INTCPS_ITR₁ register applies to interrupt line 32).

Table 10-6. MPU INTC Register Summary

Table 10-44. INTCPS_PENDING_FIQn

Address Offset	0x09C + (0x20 * n)	Index	n = 0 to 2
Physical Address	0x4820 009C + (0x20 * n)	Instance	MPU INTC
Description	This register contains the FIQ status after masking.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PENDINGFIQ																															

Bits	Field Name	Description	Type	Reset
31:0	PENDINGFIQ	FIQ status after masking.	R	0x00000000

Table 10-46. INTCPS_ILRm

Address Offset	0x100 + (0x4 * m)	Index	m = 0 to 95
Physical Address	0x4820 0100 + (0x4 * m)	Instance	MPU INTC
Description	These registers contain the priority for the interrupts and the FIQ/IRQ steering.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																								PRIORITY				Reserved	FIQ/IRQ		

Bits	Field Name	Description	Type	Reset
31:8	Reserved	Write 0s for future compatibility. Read returns reset value.	R	0x000000
7:2	PRIORITY	Interrupt priority	RW	0x00
1	Reserved	Write 0 for future compatibility. Read returns reset value.	R	0
0	FIQNIRQ	Interrupt IRQ FIQ mapping. Read returns reset value. Write 0x0: Interrupt is routed to IRQ. Write 0x1: Interrupt is routed to FIQ.	RW	0

10.6.4 Modem INTC Register Descriptions

[Table 10-48](#) and [Table 10-50](#) describe useful modem INTC registers.

Table 10-48. INTC_SYSCONFIG

Address Offset	0x010	Instance	Modem INTC
Physical Address	0x480C 7010		
Description	This register controls various parameters of the module interface.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																SOFTRESET		AUTOIDLE													

Bits	Field Name	Description	Type	Reset
31:2	Reserved	Write 0s for future compatibility. Read returns reset value.	R	0x00000000
1	SOFTRESET	Software reset. Set this bit to trigger a module reset. The bit is automatically reset by the hardware. Read returns 0. 0x0: No functional effect 0x1: The module is reset.	RW	0
0	AUTOIDLE	Internal interface clock gating strategy 0x0: Interface clock is free-running. 0x1: Automatic interface clock gating strategy is applied, based on the interface bus activity.	RW	0
